An Unexplored Horticultural Field

By JOHN ISAAC, Sacramento

IN THE early history of Horticulture in California all attempts at fruit growing were confined to the interior valleys, and here apples did not give such good results as in the East, and with the memory of the apples of our boyhood and the inferior quality of our earlier attempts with apples, we jumped to the conclusion that apples would not do well in California, and this has been so often repeated that it has become a tradition, that California can grow all fruits but apples. Some bold men who were not bound by tradition carried on experiments elsewhere and as a result, we have the great apple sections at Watsonville, Lompoc and other points on the coast.

The greatest apple country on the coast and, perhaps, we would not exaggerate if we were to say in the United States, is yet almost wholly untouched and unknown. We refer to the mountain regions of the State, where at an elevation varying from two thousand to five thousand feet, there are thousands of acres of land still open for settlers which are capable of producing apples which cannot be beaten anywhere on earth. We predict that, with the population pouring into the State, the gradual narrowing of the available opportunities for settlement, population will be forced into these mountain sections and when it once starts there, there will be a revelation in horticulture which will surprise many of our older inhabitants.

All through these mountain sections there is abundant water, most of which now goes to waste. Mountain streams and springs are to be found everywhere, many of which decrease their flow in the summer, but with land steadily rising to a higher level, with small valleys and depressions of from a few to hundreds of acres in extent, there are unparalleled oportunities for reservoiring water and no shortage need be feared.

The soil in these mountain sections is usually a deep, rich vegetable loam of unexampled fertility, generally rolling, and much of it level; the climate cooler than that of the valleys both in winter and summer, with light snowfall and some frost in the winter. The scenery and surroundings are all that could be wished.

We have seen apples from these sections that could not be excelled on earth, while the yield was all that the trees could bear. Apples from the Femmons' "Home Orchard" in Madera county have been selected by experts as models of what perfect apples should be, and have been painted and used to show what certain varieties would do under perfect conditions. Apples from the same orchard were the admiration of all who attended the Fruit Growers' Convention at Marysville last fall, and leading growers from Oregon were forced to admit that nothing in their State could compare with them.

Now we believe that here is the next field upon which the California horticulturist will enter, and once fairly started we are going to surprise the world with our apples as we have done with our other fruits. We have in our mountains the soil, the climate, abundant water for the developing, and all the conditions for producing perfect apples, and we have the assurance from examples produced, that it can be done and it will be done as soon as it is known what opportunities are offered for this industry.

The great drawback at the present time is the remoteness of these sections from market, and their isolation. These defects will be overcome in a short time, for already the electric roads are forcing their way into hitherto inaccessible mountain sections, and it is only a question of time before every point which offers any business will be reached. There is room here for thousands of families, and the young man who gets a mountain ranch suitable to apple growing will within the next few years find himself among the best rewarded of the horticulturists of the State.

The Drying of Deciduous Fruit

As Practiced in California

IN no section in the world has deciduous fruit drying reached the magnitude it has in California. The perfect climatic condition together with the abundance of fruit grown here have combined to make this possible. To fully describe this process and to give such information as one should have who expects to enter the business would require a volume of a great many pages. In fact, one to enter the business should have the experience of actual work in a drying yard before undertaking the work from any description which may be written. However, each year questions come to this office for information so that a few points may have interest for those who have their own small parcel of fruit to cure.

Evaporated.

California fruit is practically all sun dried and the evaporator here is practically unknown, although owing to the heat and lack of moisture in our atmosphere most California fruit passes in the Eastern market as evaporated fruit. Last year's flurry regarding the sulphur question is settled at least for the time being, so that the usual sulphuring may be given all fruit dried this year. We think it would be wise, however, for all dryers to use caution in the amount of sulphur used. The ruling which the Department of Agriculture promulgated last year insisted that the amount of sulphur dioxide should not exceed .035 per cent. But to sulphur fruit sufficiently to be of value so as not to exceed this amount would be probably impossible, for, as Prof. Wickson has said, the fruit as sulphured in the past, has varied from .102 to .23 per cent of sulphur dioxide, and experiment has shown that whenever the per cent of sulphur dioxide falls below .10 that the color is unsatisfactory.

It is perhaps impossible to say what is the smallest amount of sulphur one may use to fill a certain sized house, and yet acomplish the perfect bleaching of the fruit, because of the fact that fruit in the various stages of ripening requires more or less sulphur. For instance, underripe fruit takes more sulphur than that which is in just the right condition. One grower has stated that he has found that two pounds of sulphur to each thousand of pounds of green fruit is about the right amount. This will be found to vary, however, as noted with the condition of the fruit, also with the variety. Peaches for instance, will require a heavier sulphuring than the apricot.

Trays.

Trays vary greatly in size, ranging from two by three feet to three by six feet. The two by three trays are simple in construction, having a cleat across either end with sometimes a narrow strip on the back to prevent the warping of the bottoms. The larger sizes have cleats through the middle also. Formerly the sulphur house was built quite solidly with cleats so that the trays with the fruit were slid into position on these cleats. This is still followed in some of the smaller yards on the ranches, but where sulphuring is done in a large way the fruit trays are stacked on cars and the cars run on truck directly into the sulphur house which is often of very light paper construction, but at the same time built almost perfectly gas or air tight. The sulphur is usually placed in an iron pot and fired under the fruit. It may be left for three or four hours, but we believe the plan of leaving overnight or until perfectly convenient to take the fruit from the sulphur fumes, is very objectionable and one of the causes of the sulphur ruling.

Cutting.

The cutting is usually done by hand, although with apricots the almost perfection which has been secured in the more improved cutting machine which is today operating, has made that method of pitting apricots almost universally used. The cutting is usually done by piece work where it is necessary to employ outside labor, and varies from 7 cents to 12 or 15 cents per box according to size of fruit, condition of labor market, etc. This year we have noticed that some sections have discussed the idea of payiug by the hundred pounds instead of by the box. This will give more definite piece work, as boxes vary greatly in size.

Drying.

After cutting and sulphuring the fruit is run to the drying ground, which is usually a field where the sun has the full sweep all day, which has been cleaned of weeds and rubbish which may blow around and dirty up the fruit. Many who take extra care, and possibly secure additional price to justify, build racks for holding the tray, which are from 18 inches to two feet above the ground. This precaution, together with that of sprinkling the road ways, if the fruit is spread near the road, are factors which the careful fruit dryer will insist upon.

Before the fruit begins to rattle on the trays it

The 20th annual session of the State Grange was held at Vancouver, the week of June 10th.

With the Citrus Growers

MORE OPINIONS ON FERTILIZATION.

SOME years ago an orange grower in San Gabriel conceived the idea that the natural forest conditions which created more humus than can possibly be kept in the ground under cultivation would be the proper method of orange culture. Weeds were allowed to grow at will and when they became too high and were an inconvenience to the fruit pickers a mowing machine ran down the row and cut the highest of the weeds. Ditches had been laid through which water ran as needed. We have never heard the final outcome of the experiment, but so far as we know no other orchardists ever had the nerve to try. At least if they did, they are not, as a rule, following the plan today.

We now have, however, the following from Newcastle. The writer is apparently succeeding and from his statement is holding up his soil. That is all important whether it meets the approval of any one. A farmer in the warmer and dryer part of San Joaquin valley or in the Imperial valley would we believe come to grief so quickly that he could not write as favorably as does Mr. Gerald Geraldson, the writer of the following:

Mr. Geraldson is manager of the Foothill Orchard Company's property at Newcastle, about 30 miles northeast of Sacramento. We do not know the rainfall, but as it is close to the foothills of the Sierra Nevedas, we presume that it has a fairly liberal rainfall.

Now, we do not think that Mr. Geraldson's communication is "too full of error" nor "too anarchistic" to be admitted to these columns, but we do think his plan will work in but few sections of this State. Meantime, we want all the light we can get as to how to set humus, and we thank Mr. Geraldson for his statement. We understand that his orchard is set with figs.

Mr. Geraldson says:

It has occurred in the history of journalism, scientific, religious and political, that editors who have thought they desired discussion of a given subject, have only wanted further contributions in support of their individual views of the matter, and anything at variance therewith was either "too full of error," "too wicked," or too "anarchistic" to find room in their columns.

Now, if you really and truly want discussion of this question of "soil regeneration" and "soil preservation" I have several (hundred) things that I should like to say on the subject. I have had near thirty years of practical experience in California orchards, so I should be reasonably well qualified to speak.

Being a layman I am largely in sympathy with Mr. Pryse in his criticism of "classical" literature. It generally goes entirely over our heads, but I don't see any fault with the terms "humus," "nitrogen," etc.

What Mr. Palmer says about humus is good—and true, too. What he says, and what you say, sir, and what Mr. Mills says, about the best way of getting humus is where I take issue.

You have discovered the "cover crop" and you get a little of the blessed humus, and you think you have reached the acme, but you haven't, though I may not be able to convince you of the fact.

You are all doubtless familiar with the disastrous results that follow the deforesting of mountains, here or anywhere; it ultimately results in the soil being washed away, among other things. Now, when we clear the brush from land and plow the leaves and grass under, and establish a system of cultivation whereby no more grass is allowed to grow, as nature grew it, we make the conditions perfect for the soil to be washed away, and it goes.

Nature's Way.

That soil which is rich and mellow at first was made so by nature's system of depositing dry, matured leaves, twigs and grass from year to year. In fact, that was the way she made the soil, which is simply sand and humus.

You will never, anywhere, find nature making humus out of green, immature vegetation; note carefully that she always uses the dried, matured article. Why does she do so? Well, one reason is that it makes from ten to twenty times more humus. Another is that it deposits much more nitrogen.

When we cultivate "thoroughly" we not only provide a splendid means of wasting our present capital, humus, through wash, but we wear it out otherwise very rapidly and utterly prevent nature from making any more. This has been seen more or less clearly by students of the subject, and the "cover crop" has been evolved as a remedy.

Now, among other defects, the cover crop falls short in this, that it only yields from one-tenth to one-twentieth of the humus that would be produced were the same crop to be allowed to reach full maturity before being plowed into the ground. Further, it is not self sustaining as no seed is provided. Again, it involves heavy annual outlay to plant and still more stirring of a soil that gets too much already (see the good orthodox brothers' hands go up).

My experience has shown plainly that, without constantly increasing outside assistance, such as chemicals or manure, green manuring will not maintain a soil at a given level of fertility.

Bankruptcy.

Another thing; on any ordinary soil, if chemicals and manure are depended on to provide fertility, bankruptcy will ensue inside of forty years, if the ground is cropped regularly, so we may be wise to listen to the fellow with a new plan to propose.

The German forest service, with characteristic German correctness, has devised a system whereby their forest areas are made self sustaining and produce revenue in addition. In other words, their soil is constantly becoming better and their output of timber is constantly increasing without any assistance whatever from outside sources. They have simply hit on the plan of letting nature have her way without interference.

What is possible in forestry is possible in any other branch of soil culture. The only correct way to handle any soil is to keep it on the improve constantly, while still getting crops, better and better crops, and that without ruinous expense for chemicals and manure.

This is a far cry from the tale of woe of the professor who says that as

soon as the nitrates of Chili are gone we will have to devise mechanical or electrical or other means of getting nitrogen from the air or go hungry, but it is possible; furthermore, it is easy and has been successfully accomplished right here in California to a limited extent.

Call and Inspect.

I know that this is a rather big claim to be made seriously, but it is true, and if you're "from Missouri" we should be pleased to have you call and inspect.

As with the German forest service, the plan is to simply eliminate, so far as possible, human interference with nature. In this instance the interference takes the form of plowing mainly.

In Placer county we call the space between two rows of trees a "middle." Here we have a good supply of native grasses, including Burr clover, which grows more or less luxuriantly on any soil that has not been "cultivated to death."

The Method.

Six years ago, after years of virtuously diligent cultivation, in which I had reduced a once rich and mellow soil to a state where it could barely produce four inches of very scattering grass; where it baked like brick after each shower in the spring; where the irrigating water would seldom soak more than a foot from the ditches, which set like Portland cement, and where I could not possibly haul manure and fertilizer enough to make it appear and produce as it once had, I decided to try the plan of plowing alternate middle on alternate years with a view to reseeding the ground and, to some extent, re-establishing natural conditions.

I acted with many misgivings but felt that something had to be done. I dared not leave all the ground unplowed as that would be too hard on the trees and there would be some danger from fire even with the small amount of grass then available, so I compromised with precedent by plowing half of it, that is, every other middle.

The unplowed land was very hard but as the trees had been "hooked" (hoed) around and were carefully watered, we got through the summer without trouble.

The next year we plowed the middles left the first year, leaving the others, and so on, with rapidly increasing crops of grass, for four years. You understand that each year's grass was left to mature and go to seed, and was plowed under the next spring at the usual time. By that time, owing to the presence of the dry grass, and plenty of seed, there was a proportionately heavy crop of green grass which contributed its mite toward the total large deposit of humus and nitrogen.

During the four years the ground was necessarily plowed in the same direction, viz., across the flow of rain and irrigating water as far as possible, so that the grass covered middles would prevent wash, which they did effectually. The fifth year the direction of plowing was at right angles and all of the ground was plowed to smooth out ridges and to slightly check an almost too vigorous stand of grass.

This, the sixth year, the alternate middle system has been started again with two feet of heavy grass instead of four inches of thin grass as at first.

During all this time no chemical fertilizers have been used, and only about two two-horse loads of stable manure per acre per year, which was applied on the worst worn out spots to start the grass.

A Comparison.

Conditions six years ago and now compare as follows: Then it was almost impossible to soak the ground, now it soaks readily.

Then trees on old ground made but a limited growth, now they grow luxuriantly.

Then it was almost impossible to bring a heavy crop of fruit up to size, now it is accomplished readily and the quality is much better.

Then water from any source caused terrific baking, now baking is an unknown quantity.

The tradition that "every weed is a pump," etc., is all bugaboo. Soil that has plenty of humus, and has a good covering of green or dried grass, will retain moisture longer than any dust mulch. Until we tramped it down hard with stock and plowed it to death, our soil was ideally adapted to the retention of moisture.

Anyone trying this plan should continue at least four years to give it a fair test. He must neither pasture nor mow his grass but leave it carefully alone to go natures way.

Applying this plan to farming or gardening would simply mean using a given piece of land half of the time and allowing it to grow grass, the other half.

I see no reason why this plan will not work anywhere that grass will grow. The least that doubters can do in the matter is to try it.—Gerald Geraldson.

IRRIGATION IN FLORIDA.

Owing to shortage of crops in many orchards of Florida, irrigation is discussed more and more. In a recent Packer we note:

While the drought has had a very bad effect on the crop just packed, because of the shortage, action has been taken by the grove owners to meet the drought should another one come. Irrigation has been resorted to, and plants have been installed in all the large groves. Those in this vicinity who have studied irrigation and its benefits believe that as good a crop can be produced with irrigation and a drought as with good seasonable rains and no plant. They also contend that with an adequate irrigation plant much of the White fly pest, the red spider and other insects and infections which are limited to citrus fruit trees, will be eliminated in a measure. Many of the grove owners are fortunate enough to have a small lake or large body of water near their grove while there are those who have not this luxury who have to resort to artesian wells, which can be had at almost any point on the peninsula at various depths ranging from 200 to 400 feet. It is believed the flowing system is the best and some have this, while others have their land piped with drain tiles submerged, and keep them constantly flowing with water.

A NEW PACKAGE.

The Chicago Packer has this to say regarding orange shipping from Florida:

"Preparations are being made for shipping the coming year in barrel crates in order to avoid the high rate of freight which bulk oranges take The barrel crates that are being ordered are thirty-six inches long, partitioned to hold over 2 boxes of oranges. They will be packed loose in the grove with no wrapping or packing. This package will come under the tariff schedule the same as the cabbage crate and will hold a little over a flour barrel of oranges."

Deciduous Fruit Culture

GUMMING OF STONE FRUIT TREES.

THERE is always more or less gumming of apricots during the early summer in some districts, and if not attended to in time often kills a tree and always is an injury if neglected. Simply splitting the bark lengthwise with the trunk of the tree will relieve the trouble at once. There is no need of trouble if this is done as soon as the first gum makes its appearance. Sometimes a tree will have a dark appearance and the bark will be tight. In such cases splitting the bark as indicated will have an almost immediate effect.

What is known as sour sap is an entirely different disease and when this shows on an apricot tree it is past relief. Just what the cause is we do not know, but the remedy, if there is one, must be brought into play before there is any evidence of its need. Large areas or even a large percentage of trees in an orchard are never affected. It appears to be a spasmodic disease that is out of our control. Sometimes but one tree in an orchard will be affected and again many scattered about will be affected.

Our attention was called to a vineyard in which a number of vines appeared to have sour sap completely encircling the trunk. This was a new complaint, and the fact that this diseased sap forced its way around the trunk of the vine suggested slitting the bark as a measure of relief.

THIN YOUR FRUIT.

THE prime object of thinning is to improve the size of the fruit. Benefits of secondary importance are: More regular bearing, longer life of the tree, and no doubt larger total production in the long run. In the peach, where the fruit is borne on one-year-old wood, a strong new growth is necessary for the production of flower buds for the succeeding year's crop. In the apple, pear and some varieties of plum, the fruit is borne on fruit spurs, and strong but not over-vigorous growth and plenty of reserve food are necessary for the development of fruit buds. It is the exception rather than the rule for fruit spurs to bear every year, so we must really have two sets of fruit spurs if we expect to have the tree bear regularly. One can then see that the wanton destruction of fruit spurs as a means of thinning is a mistake. Experiments show that, on most varieties of apples, at least, thinning does induce annual bearing. It is safe to say that thinned trees will bear as many boxes of fruit in two successive years as the unthinned trees, 95 per cent of which will grade "Fancy," as compared with 50 per cent "Fancy" from the unthinned trees.

The judicious use of the pruning tools in early spring saves much hand thinning. The grower will have to rely a great deal on his own judgment as to just how far pruning will take the place of May or June thinning. The peach tree may be pruned much more severely than other fruits on account of its habit of bearing fruit. The removal of wood as a means of thinning in the peach should not in any way injure the next year's crop. The heavy pruning would rather stimulate the growth of strong fruiting wood. Even in June thinning the pruning shears are a necessary article in the thinner's outfit. Many branches may be clipped off or shortened to save the labor of hand thinning. Pruning as a means of thinning apple and pears must be exercised with more care.

Two general plans may be followed in June thinning. One is to thin to a certain distance, the other to leave a certain total amount on the tree Where the first plan is followed, the general rule is to leave a fruit every six or eight inches in the peaches or apricots, and not less than eight in apples and pears. It is a fairly satisfactory method for the experienced pruner, but unreliable for the grower, who, from lack of courage, fails to prune properly. Probably a better plan for such a grower is to thin not so much to distance as to leave a certain amount on the tree. By thinning and actually counting the remaining fruits on a few trees, the eye can soon be trained to judge what a well-thinned tree looks like. Then, of course, the question comes up as to how much a tree should bear. This will depend much on the vigor of the plant, soil conditions, and water supply, as well as the variety.

Stone fruits should be thinned before the pit hardens. Apples may be thinned later and after it is certain how heavy the crop will be.

Some thin with poles and knock off many fruit spurs and injure the trees. This is the most economical, or rather the quickest, but we believe not the most profitable in the long run.

If farmers and orchardists would pick off all imperfect fruit, it would be better for the trees and better for their pockets when fruit is marketed. If only No. 1 fruit was sold the market would never be glutted. All No. 2 apples ought to be dried or made into cider.

"LITTLE PEACHES."

We have been asked if the disease known as "Little Peaches" is now in this State. We do not think so. This is a disease that kills the trees in about the same manner that "yellows" does. The fruit will run all sizes, from full size down to as small as the thumb with large pits in all of them. It is very often the case that trees in the southern part of the State will produce small fruit along with that of full size, but this is due to improper leafing out of the trees, as far as we have been able to determine. Very often the trees will not leaf out properly all summer long and the bloom will drag along about the same way. Many of the peaches appear to be improperly fertilized in the bloom. The whole trouble seems to be that the trees grow and bloom out of season, due to uncongenial climatic conditions. Winters with occasional warm periods of weather which cause the buds to swell, followed by cold spring weather seem to be the forerunner of this unnatural development of foliage and fruit. It is demonstrated beyond a doubt that the climatic conditions of Southern California, as a whole, are not suited to the growing of large crops of first class peaches. It is true that they are very profitable some seasons, but taken one year with another they are very unsatisfactory.

The two distinguishing points between "little peaches" as known in the East and our small peaches caused by unnatural growing periods, are that in the case of the former the trees rapidly decline and die, as with the yellows, and the pits are large in both small and large fruit. In the case of the latter, our Southern California trouble, the trees overcome the weakness when favorable seasons return. The other point is, the small peaches have small pits.

Irrigation by Flooding.

PEACH TROUBLES.

There is a new theory regarding the cause of yellows in peach trees. It is claimed that evidence shows that the principle cause of yellows is due to atmospheric conditions that render the trees more susceptible to the disease, while the direct cause is due to a sort of poison that is carried from one tree to another during blooming time and does not develop till a few years later.

During the last twenty-five years, there has been trouble in the peach orchards of England that seems to be allied to the peach yellows of this country, but more like the mottled leaf of our orange trees. The leaves become white with nothing lacking apparently except the chlorophyl, yet the trees become sickly and unproductive. Heavy fertilization, however, for two or three years will overcome it.

There is a disease that is met with occasionally in this State where the peach leaves turn a golden yellow without any apparent cause. Often a branch on one side of the tree will be affected and the balance of the tree will remain healthy.

Berry growers of Santa Rosa recently held a meeting and organized an association for the pooling of blackberries of that section.

PLANT DISEASES.

IT causes much satisfaction to grape growers of Southern California that the Anaheim disease has not been so active during the past few years as it was many years ago. It is not due to any treatment that has been afforded the vines. Neither have new varieties been introduced with the object of securing immunity thereby, for the old sorts are growing luxuriantly in many sections and no sign of the disease has made its appearance for years. This is, indeed, encouraging as it shows that the virulence of the disease has spent itself in most parts at least, and this is a good sign. It not only argues that we may in time have no fear of this blighting scourge in our vineyards, but we may hope that such insiduous diseases as pear blight may some time be under better control, at least in many sections. Indeed, this is now apparent in some places at present. During the past winter it was our privilege to inspect some Bartlett pear orchards where, though they had been infected with pear blight for five or six years, and still had traces of it, the disease had made no progress and abundant crops had annually been harvested. It is a well known fact that trees making a small annual growth are not susceptible to pear blight; that trees making a rank growth are. Climatic conditions also affect the development of the disease. There is hope in the possibility of pear trees growing under these conditions developing a strain of trees that will be immune to the blight. There are some varieties of pears that are apparently immune when growing in close proximity and blooming with Bartlett pears that have been cut down in one season with the blight. The Cole Seedling, for instance, is one. This pear survived and was not even inoculated, while pears and apples all around it were dying back with the disease. It does not seem that California can produce a blight-proof Bartlett with her desert conditions and immune varieties that are now available. This is the only recognized safe method that is given for placing the walnut business on a sure basis. There is no doubt but that we would now have a comparatively immune Bartlett pear if as many seedlings had been grown from this as there have been from the walnut. Of course, the two cases are not parallel, for the immune walnut is a late blooming one while the pear must have internal resistant qualities. Several years ago this department urged this same theory.

GRAFTING APPLE ON PEAR.

Experiments have been made in Colorado with the apple grafted on the pear, and apparently with complete success. The chief advantage of grafting apple on the pear root lies only in its exemption from attack at the root by the wooly aphis or apple louse. Its greatest injury is at the root where it cannot be successfully or effectively eradicated. It would be an interesting experiment to make with pear stocks grown seeds of the old native Mexican pear. Some of these trees are said to be 300 years old and it might be found that apple grafted on these vigorous trees would be not only more thrifty and free from attacks of insects at the root, but longer lived than are our trees on the apple stock.

COUNTY OFFICIALS TO BE FIELD ASSISTANTS.

The Department of Agriculture of the State University is to have assistance from some of the experts in entomology appointed by the different counties. Mr. J. S. Hunter of San Mateo county has been made Field Assistant in mosquito studies. Mr. Earl Morris of Santa Clara county is to study the life history of the California peach root borer and its treatment, and Mr. W. H. Volck is studying the control of the potato worm in Monterey county and in Santa Cruz county is making special studies of the control measures for the woolly aphis. The honorary positions of field assistants in connection with experiment station work in entomology carry with them no pay from the university, but are a recognition on the university's part of the value of the county officials who have been asked to serve.

DRY ROT ON GRAPES.

The French experiment stations have been testing dust and liquid sprays for the control of the dry rot. In addition, removing part of the foliage and reducing the amounts of nitrogenous fertilizers were tried. In all, six powders and about one dozen liquids were used in the tests. The results showed that in seasons unfavorable to the development of the disease, there was no treatment that made any reduction of the disease over the same in the check plots, but during seasons favorable to the development, sprays were of much benefit. It was also observed that in cases where nitrogen was abundant in the soils, the disease was much worse. This was, course, due to the vines putting out abundant foliage which makes favorable conditions for fungous growth.

SUCKERING.

Whenever the spring growth commences, whether on established trees or those newly set out, shoots will put out where they are not wanted and the sooner they are attended to the better. As soon as they can be seen they should be rubbed off with the hand. A good leather or buckskin glove will facilitate the work. Many trees that have been neglected in their early days will persist in sending up suckers from the roots which come year after year. They can be effectually stopped by digging down to the point of origin and breaking them off close to the stem. A little attention at planting time will save much of this.

ADVANTAGES OF DRY AIR.

The dry atmosphere of this State is an advantage when we have to use copper fungicides. Experiments have shown that when the leaves of plants are protected from dew and rain, stronger washes may be used with increased efficiency, while when the leaves are wet a weaker solution must be used. Coast districts must use a weaker solution than is safe to use inland.

VALUABLE CATALOGUE.

The Southern California Acclimatizing Association of Santa Barbara has issued a new price list, which has a great value for the plant lover. It lists most of the well known plants introduced to California gardens, and also is complete in the lesser known plants which this concern is continually introducing from other countries. Mr. Franceschi, who founded the association, was first to introduce the Lippia repens which has become so popular in this State.

DECIDUOUS FRUIT DRYING.

Continued from page 3.

is often stacked and left for a day or two to cure in the stack. If trays are short they are often doubled up at this time two or three trays being often dumped onto one. This stacking has the double advantage of not curing too rapidly at the end and also of protecting the fruit from the night dew which is liable to darken the fruit.

Sweating.

When fully dried on the trays some of the smaller fully ripe pieces will dry much sooner than the larger and greener ones. If this difference is very great, which it may be if the fruit is ungraded before cutting, hand sorting to remove the large and under-dried pieces to other trays is often done. But where the fruit does not vary too much the entire tray is dumped with others into the sweat box and there allowed to remain four or five days. More often in the large drying yards the fruit is dumped into the bins in the curing room where, after a few days, the pile is turned or shoveled over to prevent its molding during the sweat. Failing to turn the sweating fruit often is where the novice may fail, because we have seen where its being neglected a day or so too long has ruined large quantities of fruit by molding. One must be sure also that the fruit is not sacked, until after the sweat, as discoloration, at least, and perhaps mold will follow.

Re-sulphuring.

We will not discuss re-sulphuring, which is the taking of the fruit after it has gone through the sweat and possibly been stored some time, dipping in hot salt water, sulphuring heavily, then packing. It is practiced almost universally and is the cause of much contention at the present time, many growers claiming that were it not for this the grower would have no trouble with "Ruling 76." We must say, however, that while the Cultivator leans heavily to the side of the grower in this controversy the buyer and packer is an important factor whom we must consider and that he claims his experience calls for the re-sulphuring in order to destroy any insects which may have infested the fruit between drying and shipping. It is a practice which is abused outrageously, however.

Finally.

Have the fruit fully ripe before gathering, but do not allow to get too mushy or soft. Green fruit makes unsatisfactory little dried chips which lowers the grade of the entire output.

Make clean cuts and do not mash or muss the fruit more than necessary. If nice shaped fruit is desired do not crowd too close together on the tray.

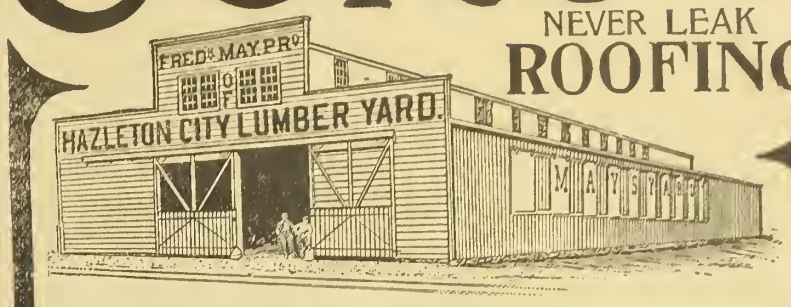
Some watch the sulphuring and do not allow the fruit to remain after the "cup" becomes filled with the fruit juice. If best prices are expected dry on racks and keep out of dust as much as possible.

Do not dry too hard, and keep the fruit with that velvety touch, which experience only can teach you.

Good openings for growers of small fruits near most every small town. Look about and see if the market is supplied with fancy home grown berries.

CONGO

NEVER LEAK ROOFING



CONGO Ready Roofing is like a government bond — the best and safest investment you can make.

It may not be the cheapest roofing you can buy at the start, but in durability, satisfaction and economy in the long run, there is nothing better.

Congo is proof against every kind of climate and weather and is almost as soft and pliable as rubber.

It is easy to lay and clean to handle.

Send for a free Sample and you'll see what a real "never leak" roof is like.

Placer Nurseries

We have now growing for next season's delivery a large stock of all leading varieties of trees and vines. We propagate only the best commercial sorts. Our trees and vines are the best that good care can produce and in their selection, propagation and growing we spare no labor or expense; and they are true to name. That is what you want.

Contract now the trees and vines you will want for next season's planting.

Write us.

Silva & Bergtholdt Company
Newcastle, California

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

THE O. & W. THUM COMPANY
Manufacturers of Tanglefoot Fly Paper Grand Rapids, Michigan

Largest National Bank West of Denver and South of San Francisco

Small Fruits and Vegetables

THIS MONTH.

THIS is a good month to use judgment in the application of water. It is a month to stop "sprinkling" and irrigate. By ""sprinkling" in this connection we mean the light spraying over the surface of the ground which does not give water down to the roots, but furnishes a crust which repels and aids evaporation and loss of moisture. So don't sprinkle in the garden, or if you do, do it so thoroughly that the moisture reaches into the earth and to the roots. Then when soil is in right condition cultivate thoroughly.

Before planting seed like radish, lettuce, etc., have soil in moist condition, and the moisture deep in soil. Then after planting lay some light covering like burlap or old barley sacking over the place planted. This will prevent loss of moisture and the formation of a crust. A mulch of coarse manure will also prove excellent. Quantities of seed are lost every summer by neglecting to mulch the ground after seeding; these small seedlings are very tender. When just sprouting, they burn very quickly when they strike the hard burning crust that is over them. This is a matter of great importance, and with a little extra care one is able to have nice crisp lettuce and other vegetables in the heat of the summer, when they are greatly appreciated.

Sow casaba melons, squash, cabbage, green and lima beans, cauliflower, Atlantic Prize tomatoes for winter crops, lettuce, radishes, onions, beets and other small truck for the home garden this month.

HOW TO TELL WHEN MELONS ARE RIPE.

THERE are many signs of a ripe watermelon, the elongated ones are quite easy to tell when ripe, the round ones are, without exception, hard to tell when ripe.

A watermelon as long as it is still growing carries a bright glossy color having the appearance of a coat of varnish recently applied. As soon as it stops growing there appears a small spot at the place where most exposed to the sun, which has the appearance as if the varnish had been rubbed or worn off. When this has extended over nearly all the upper surface the melon will be found to be ripe; at the same time the melon forms a thin shell just under the skin or bark; it is thinner than one's finger nail, but rather hard, and if you try to scrape the bark off you will find your nail will run along on a smooth hard surface, apparently as smooth and hard as the top of a polished table. This shell forms first on top, gradually extends to the bottom enclosing the entire melon. When it is formed on the bottom the melon is ripe, so when the bottoms will scrape as stated above, and the melon is at the same time hard on the bottom, it is ripe; there are many other signs, but none as reliable as the above; generally if you are in doubt as to whether a melon is ripe or not, you will generally find upon cutting it, that it is green.

Musk and cantaloupe melons are never ripe until they slip the stem. The winter casaba melon does not slip the stem neither does the hybrid casaba, except the Imperial casaba, a variety recently propagated by the writer; this melon slips the stem just as does its father the Early Hackensack.

A muskmelon or a cantaloupe, during the last twenty-four hours on the vine, changes its starch to grape sugar, but if picked green is unable to do so. The casaba melons on the other hand, take several days to change their starch to sugar, and can be picked as soon as that process is started, and ripen to perfection—just as does a pear—some time afterward.

The new watermelon, the Angelino, is harder to tell than any other melon. It must be left on the vine until it looks overripe, as compared with the Chilian watermelon.—J. C. Ostergard.

HINTS ON PACKING SQUASH.

J. A. Eveleth, the well known commission man, of San Francisco, gives a few directions for properly packing summer squash for the market.

It should be packed from the top to the bottom, not from the bottom to the top, to get results. In other words, nail on the top of the box before you commence to pack, and the bottom when you are through, turning the box over with the stencil or address showing on the top. Select squash of uniform size for your first layer, and fill the box plump full, so that the bottom will spring somewhat when you nail it on. This will keep all in proper place and it will be attractive when you remove the cover. A layer of paper next to the top will keep the squash from grating against the rough wood, and in that manner assist in making it attractive. Try a box yourself and see what an improvement it is over that which has been packed at random, without any particular regard to the above-mentioned points.

So large a proportion of receipts has been of unsatisfactory quality and pack that prices have been driven to a point that is ruinous; in fact, it has been almost impossible to induce the trade to take at any price much that has been coming forward.—Brawley News.

GARDEN NOTES.

Where nitrate of soda is used it should always be covered with soil.

To raise early beets make a little trench beside each row, and scatter in a little nitrate of soda and cover it.

If you want early squashes or pie pumpkins, work into the soil around each vine a handful of hen manure.

The best crop to follow early peas is squashes. Peas add nitrogen to the soil, and this must be present in order to raise a good crop.

To raise early cabbage, begin when the plants are small, and scatter around each a little nitrate of soda, and repeat every two weeks.

If you want ripe tomatoes early, make the ground rich with fine barnyard and hen manure. When you set out the plants, cut off all the lower branches, and work into the soil around each a teaspoonful of nitrate of soda, and repeat every ten days.

On Monday morning June 15th, a solid train of 63 cars all loaded with Imperial valley cantaloupes and drawn by two Jumbo freight engines, was a sight to convince those who saw it that the world does move. Five years ago that same section was called the Colorado desert.

The Ornamental Garden

THIS MONTH.

SOW pansies and stocks for winter blooming. Sweet peas for late flowering are also sown this month. Chrysanthemums have to be watched closely from now on. All suckers should be cut off as soon as they appear, large side branches removed and only a limited number of buds left on each plant so as to throw all the strength of the plant on the few remaining buds. Green aphis and other insects will appear, but can be easily removed by the use of tobacco dust. Cut back rose bushes and keep them pretty dry, this will give them a rest and enable them to bloom heavily next winter. Eucalyptus, acacia and other ornamental stock can be sown this month.

Keep all plants well irrigated. This is a trying month, yet one of much satisfaction in the garden. Gladioli are in their glory now. Give them lots of water. Shasta daisies are giving a wonderful bloom this year. The writer recently picked over 500 long stem bloom in one day and the bed hardly showed any lack of bloom.

Rake the lawn often as the Bermuda grass is spreading to beat everything. A good raking helps to hold it back. In the fall it stops its rapid growth when fertilizer and water help the blue grass to keep even with it.

IN MY GARDEN—A SYMPHONY.

My garden is the place where the birds sing to my heart, and the flowers cradle most beautiful thoughts. On every leaf of each plant, bush or tree is written the promise which the new of the morning gives to the light of day. And this promise is, that the dewdrops shall be bridesmaids to each sunbeam; and as the sunbeam weds a rose, a daisy, a violet, or a sweet-pea, so each bridesmaid succors and strengthens and refreshes the bride.

Said a little primrose to me in the early dawn as I came to watch its unfolding: "Come with me from out the dark underground of the travail of life and open your heart to the sunrise." And as it thus spoke, the many-veined leaves of its body quivered in the joy of the ever eternally growing life.

Just then a butterfly came to visit the hollyhock, and as it greeted each blossom great exclamations of mutual joy were heard. Even the silent, wise ivy, that had grown sad with the story the winds of heaven had told of the vain strivings of men, smiled and turned the ears of its leaves to eavesdropping.

And as they all rejoiced, a humming bird flirted with a whole group of nasturtiums, and as it pierced their hearts again and again, they bared their bosoms to his eyes of love. A violet peeped from under dark leaves and looked with wide open eyes upon a merry daisy whose petals had an argument of their own with a pink geranium which had grown at its feet. A bee rose from his bed of sweet-peas, its eyes swollen from its dream in the heavy sleep 'midst honey, and bidding "Auf wiedersehn" to the tiger lily, sailed leisurely into the air.

And all of the flowers were so true, so full of promise, so rich in hope—and as I looked, and saw, and spoke to them, my heart flowered in my garden, and as I watched the full-grown rose, of its ache, grow and grow from out its shadow into the sunlight of hope—I closed not the gate, but hold it open now, and forever, and the peace of all time.—Ex.

KEEPING FRESH FLOWERS.

Very few persons understand the art of keeping flowers, and yet, by a little attention flowers may be kept fresh for three or four times as long as people expect them to stay in good condition.

The matter is simple enough. It is merely a question of temperature and moisture. Roses, for example, are grown at a high temperature in the greenhouses, and are then generally spoiled by ill treatment after they have been cut. Grown in a temperature of 65 to 75 degrees, they are placed in an icebox, where the temperature stands at about 40. Then when sold they are taken into a dining or ballroom, where the temperature is 78 or 80. Of course, they wilt in a few hours, and sometimes in a few minutes. Nothing else could be expected.

They could, however, be kept in proper condition for a week by placing them in water and standing the vase in the coolest part of the living room. Every day half an inch of stems should be cut off in order to present a fresh suction surface to the water. If this precaution is neglected the stems become clogged with a glutinous matter, something like the gum that exudes from peach and cherry trees, the water in the vase, however pure, cannot be drawn up, and the leaves and flowers wither for lack of moisture.

In cutting off the stems a knife should always be used, never a pair of scissors. The reason is plain enough. The knife makes a smooth cut, leaving the cells of the wood open and unobstructed. The scissor blades, no matter how sharp they are, always compress the woody fibers at the end of the stem and leave them so tightly pressed together that it is almost impossible for sufficient moisture to find its way through to support the leaves and blossoms.

In Golden Gate Park, San Francisco.

In the Date Garden.

TRANSPLANTING WILD FLOWERS.

There is no better time to transplant wild flowers than when they are in bloom, contrary as this is to general garden practice. Indeed, it is not easy to recognize them at any other season amid the luxuriant tangles of vegetation with which they are usually associated.

Before digging the plants desired for removal it is necessary to select a spot which may be devoted to them exclusively. Only a few species will thrive in the highly enriched and frequently worked soil of the garden bed and many species will not bear exposure to the full sunlight. Some semi-shaded spot should be chosen, preferably with an eastern or northern exposure. The north side of a rather high hedge has, in the experience of the writer, proved specially advantageous.

Most kinds will grow well among a clump of tall shrubs, but around the roots of large trees these windlings seldom thrive, and the only fertilizer that most of them will endure is thoroughly decayed vegetable compost or leaf-mold from the forest.

To transplant successfully one must set about it early in the day, so that the collecting and replanting may be completed in as short time as possible.

A large basket or box should be provided and a small spade will be better than a trowel for taking up the plants, as many have a deep and spreading root system which one must carefully preserve. It is best also to take with them a considerably quantity of the soil in which they naturally grow, as this will help to acclimate them to their new location. After lifting keep them shaded from the sun and screened from the wind.

Plant quite deeply and fairly close together, firming the earth about the roots with a gentle pressure that will not break them and settle with a copious watering. By following these directions scarce a plant of any species will fail to grow, and the wild-flower garden will soon prove one of the chief attractions of even the most park-like place.

MORE MILK—MORE MEAT

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the rosults quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.
A. F. CHAPMAN, Monohan, Wash.

Live Stock and Dairy

DEVELOPING THE HEIFERS.

THE heifers of great dairy herds are as systematically developed as the fillies of the racing stables. The record breaking butter producing cow does not just happen, she is a skillfully made product. A really developed product from education, one that is of great refinement of functions and must be handled with skill, if she is kept at her best. I often envy the man that can stand by the feed box of his cows at every meal time and see that the feeding is done perfectly. A ranch with only a dairy herd to look after would be a picnic, as far as work was concerned for the owner. When orchard, vineyard and dairy all come together it gives more care, yet one makes money for the other. When the table grapes brought in five hundred dollars an acre, the cows were bringing in fifty-one dollars net year per head from butter alone. The vineyards were enriched with the stable manure. Calves and pigs raised on the skim milk were clear profit.

Training.

The cows must be made profitable by being trained butter producers, to be profitable at the present prices of feeds. It is only by trying different feeds and keeping a large number of heifers under observation, that we can come to an understanding of the general principles. We must lose sight of the individual peculiarities of each animal to grasp the principle underlying the whole matter of feeding. "Knowledge comes, but wisdom lingers." Slowly must we learn what to do and what not to do. The whole cow must be balanced against the strain of excessive milking. She must have extra good feeding quality, but in turn the food must be converted into milk and not put into body fat.

Udder.

The actual milk organs are the udder and teats, while the milk veins are blood feeders of the milk that comes. The udder of a cow is complexed and interesting as it is in its make up, but is not to be considered now. In the different breeds it has distinctive shape the same as any other characteristic of the breeds. The Durham and Ayrshire have longer udders; the Jersey's is carried neatly, nearly directly under the hips so that it often shows a large part behind the legs. The Holstein udder is a square affair with a teat at each corner spreading well forward. These are the extreme of the types for all merge one into the other in the various individuals.

Judging.

The amount of milk a full blooded cow will give is easier to guess from her udder development than in the common or mixed type of cows. Many prove to be better than they look, having more udder capacity tucked away somewhere than appearances seem to indicate. The common deficiency of the fore udder is seen in all classes of cows. Many show animals are spoiled by lack of fore udder. The heifers must be closely watched during the first lactation; if the milk flow is less than proper amount as judged from the flow of the back teats, then knead or massage the forward portions carefully after each milking for the whole period of milking.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Lost Udder.

The loss of half the development of the front udder is losing a quarter of the milk the cow is capable of producing. If the cow could produce twenty pounds of butter and by lack of development produces only fifteen, the loss is at once seen to be considerable. Four cows giving a good flow of milk ought to produce 1600 pounds in a year; now reduce that a quarter from lack of udder development and another first class cow will have to be secured to make up the loss. The expense of milking a cow giving 300 pounds of butterfat is as great as though she made 400 pounds. The difference in the feed consumed is hardly appreciable in the feed bills. The stable room is taken up and all the additional expense of the poorer cow is on the wrong side of the ledger. In fruit growers parlance it is close to "red ink."

Fleshy Udders.

Some cows having seemingly large udders are gay deceivers, for the udder is a fleshy mass instead of a mass of loose tissue. The udder should be rigid before the milk is drawn, after milking it is soft and has a feeling of spongy flexibility; it is soft and compressable to a slight degree rather than stiff. The teats are often not considered of much importance, yet if they are not good sized and not easy to milk there is little chance of the heifer coming to full development under hand milking. I have seen cows with teats so large that I could not close my hand around them; others again, so small that they had to be stripped with the two fingers. The small teated cow can be helped by letting her calf nurse her the first season, watching carefully until the calf begins to eat, then milking out the remainder of the milk, so that the cow will not be dry too long a period. When the teats are too large the only thing to do is to sell her to some big fisted people to use in their dairy.

Milk Veins.

These are found on the stomach of the cow and carry blood, not milk as some people suppose. The length and convolutions as well as size of these veins show the amount of blood pressure and milk forming ability of the cow. The heifer often has small ill formed milk veins. Now watch the development for size and convolutions. The heifer that receives a large amount of succulent feed develops these veins rapidly. Push her along with silage or green soiling crops.

Succulency.

Green food is safe for the heifer's development; it will bring her forward fast. Excessive grain feeding will not answer for this purpose. In the mature cow it will hold the milk to full production. When we feed a cow with poorly developed milk veins a heavy grain ration after she has put on her back all she can carry, then if still pushed inflammation occurs, and congestion of the udder often will result in a loss of part of her udder. The breeder that has no provision for silage for his heifers should not try to have them freshen in the fall. That will prove not practical, if they are to be developed into heavy producing cows. He must have them freshen in the spring and push them on green alfalfa or on sorghum or Indian corn.

Developing.

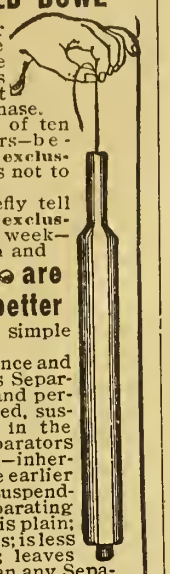
The milk veins must be developed as early as possible in the heifer, for without she has a large supply of milk making materials she cannot possibly give milk. The blood in the veins is the source of her strength and measure of her ability to convert food into blood.—M. E. Sherman.

WHAT'S THE USE.

We are annually paying tribute to the genius and foresight of European stock breeders to the extent of several million dollars. We go to Scotland for the Clydesdale horse, to France for the Percheron and the French Coach, and to England for the Shire, etc., writes the Professor of Veterinary Science, Colorado Agricultural College. This in itself is not so bad, provided we make the best use of these breeds after we get them. No country on earth has better natural conditions for making and perfecting high class breeds of live stock than this, and yet it is a fact that aside from the American trotting horse and a breed or two of pigs and chickens, we have never produced in the entire history of this couutry one single pure breed of live stock. The Yankee who enjoys the reputation the world over for his keen business instinct has in this respect gained the unenviable reputation of being the rankest kind of a sucker. We go across the water and pay thousands of dollars for pure bred sires, bring them over here, and thoughtlessly mate them with mares of every known breed without ever a thought of purity of blood or the ultimate establishing of pure breeds at home. All sorts of crosses have been made in this way and the result is that we have a heterogeneous mixture, lacking in uniformity, and a large percentage of them without merit. As a result again of this foolish practice we have a superabundance of horses without any particular qualities of excellence, which go on the market as general purpose horses and command the lowest price in every market. Out of this heterogeneous collection of nonentities there are, of course, a few surprisingly good individuals; but the males should never be used for breeding purposes, as they lack in prepotency, or power to transmit their desirable characteristics to their offspring. The mares may be profitably bred, but always with the view of grading up by successive top crossing with pure bred sires of the same breed. Five such crosses are supposed practically to obliterate the native blood, and according to some of the stud books, produce what is known as pure bred horses. In general, our farmers are quite particular about the breed and points of excellence of the horse used as sire, but the mistake has been in not persisting in using sires of one breed and of equal excellence until purity of blood, a greater degree of prepotency, and a uniform excellence of offspring are secured.

The other day I was riding on the range with an excellent stock raiser of the Western slope. I noticed a Shorthorn bull running with a herd of Hereford cows and asked for an explanation. I was informed that the Herefords were weak in one point of conformation, and in order to improve the herd a Shorthorn bull strong

EXCLUSIVE
Tubular
ADVANTAGES No. 1
THE
SUSPENDED BOWL



In buying anything for farm or home, it's the superior advantages—the exclusive features one has which the other has not that influences your purchase.

That's why nine out of ten buy Tubular Separators—because they get so many exclusive, superior advantages not to be had in any other.

We are going to briefly tell you about these Tubular exclusive features—one each week—that you may see wherein and

WHY Tubulars are so much better

The first is the light, simple suspended bowl.

After years of experience and experiment the Sharples Separator Company invented and perfected the only bottom-feed, suspended separator bowl in the country. All other Separators use the supported bowl—inherited and adopted from the earlier types of Separators. The suspended bowl has greater separating force; is absolutely safe; is plain; smooth and without angles; is less weight; has fewer parts; leaves less butter fat in milk than any Separator or process ever invented.

Write for catalogue 260 and let us tell you more about how and why exclusive Tubular advantages are money makers in your dairy.

The SHARPLES SEPARATOR CO.,
West Chester, Penna.
Toronto, Can., San Francisco, Calif., Chicago, Ill.

in this particular had been secured to get an average of the two extremes. The experience of careful breeders everywhere has been that this plan will not succeed. It is, for example, as erroneous in theory and fruitless in practice as that of crossing a mare having cycle-shaped hind legs with a horse having straight hind legs, expecting that the offspring will be an average of the two parents. This is not nature's method. Perfection is not secured by two imperfections, and all efforts in this direction will be disastrous in the extreme. The better plan is to castrate the stallion and breed the mare to as perfect a horse as can be found.

What is the use, then, after having made a good start by infusing pure blood for the first cross, of spoiling it all by changing to some other cross. Why not follow some concerted plan in the grading up operation until a reputation has been estabished for horses of real merit?

CALIFORNIA TRANSFERS OF HOLSTEINS.

The following transfers of California Holsteins were made for the week ending July 13:

COWS—Belle Midget, Blance Bates, Daisy Belle Korndyke, Fabiola of Sleepy Hollow, Florend, Kaamilla Korndyke and Peacherino, S. Herzog to Joseph Daneri, San Francisco. Kneeland Carlotta, J. C. Cochran to H. G. Gross, Eureka. Kneeland Viola, J. C. Cochran to H. G. Gross, Eureka.

BULLS—Beryl Wayne Korndyke of Riverside, Jetz Zwartuak, Romeo Aggie Acme of Riverside, Charles D. Pierce to Schleef & Hodgkins, Lathrop. Don Aginaldo, J. M. Spencer to M. L. Finch, Gardena. Riverside De Kol Korndyke, Charles D. Pierce to L. A. Hall, Modesto. Riverside De Kol Oleander, Charles D. Pierce to L. A. Hall, Modesto.

The contest between American horses and bronco ponies in the race between Evanston, Wyoming and Denver, Colorado, resulted in victory for the broncos. The distance was 507 miles. Twenty-five horses started.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

GRUBS UNDER CATTLE SKIN.

The grubs, as found in the backs of cattle from March to June, are the larvae of one of the flies which annoy cattle during July, August and September. They are a large black fly, the size of a bumble bee. They alight upon the backs of the cattle and each deposits an egg which soon hatches into a larva (grub) of very minute size, which burrows beneath the skin and there remains and develops until the following year, when, about June 1, he works his way out to the surface of the animal he has been living upon, rolls off to the earth, where, if he alights on soil that is dry and warm he can burrow in before some bird or rodent gobbles him up. He in due time takes on wings and becomes a fly. In case he alights in a mud hole or on a rock his day is done. Thus we see that the life of this grub is largely based on luck. So much for his history.

I have found from experience that when cattle are daily sprayed with the fly mixtures of various kinds during the summer and early fall months that the same will keep this particular fly away. I am also convinced that were oil of tar, mixed with any of the cheap animal or mineral oils in proportions of one pint of oil of tar to a half gallon of the oil, and sprayed on cattle once a week, it would act as a repellent to the fly that deposits the egg which causes the grub.

Now, as to getting rid of them when once lodged in the backs of cattle. There are several ways. One is to put a few drops of kerosene from a small spring bottom oil can with a small spout into the hole that will be seen in the hide of the animal. This will kill them. The passage of an awl into the hole for half an inch will also kill them. But there is an objection to both methods. The grub is left to fester and rot away, which sometimes makes a sore on the back of the animal, and if there were a large number of grubs in the back of one animal there would be some danger of septicemic poison of their blood. I therefore recommend that they be squeezed out and killed, using a sharp knife to enlarge the opening. It can be done quite rapidly, yet, of course, will take very much longer time than with either of the other mentioned methods. By killing the grub one ends the trouble, as, if allowed to develop into a fly, it may deposit eggs enough in one season to infect a whole herd. I therefore advise extermination by killing him before he is born, even though it takes a little more time to do it.—Journal of Agriculture.

To keep lice and vermin from calves or dogs, a thorough application of alcohol, turpentine, or kerosene oil will do the work. The alcohol is much to be preferred, from the fact that it is quite as destructive as any of the others, does not soil the animal, and after ten or twelve hours has entirely disappeared.

STABLE MANURES.

In a bulletin issued by the Maryland Station treating upon stable manure, we note:

The results, as a rule, favored the use of fresh manure applied directly from the stable as against rotted manure. The best results were obtained by applying the manure as long in advance of the time the crop was to use as possible. As between applying fresh and rotted manure before and after plowing, the results favored applying fresh manure as a top-dressing after plowing. In a comparison of plowing under manure in the fall and spring, the differences were slight but uniformly in favor of allowing the manure to remain on the land during the winter and plowing it down in the spring. The results favored plowing under to a depth of 7 inches as compared with a depth of 5 inches. Subsoiling in addition to deep plowing did not show sufficient advantage to warrant the extra expense involved. The benefit derived from adding commercial fertilizers to the manure was not very pronounced in case of wheat. In case of corn some benefit was derived from the use of small amounts of complete fertilizer in the row in addition to the manure. "The use of kainit with the manure seemed to exert a beneficial influence every year, and it was more marked in dry than wet seasons." Applications of straw at the rate of 2 tons per acre produced a considerable increase in yield but was not so valuable in this respect as manure. The growth of crimson clover was better on soils receiving fresh manure than on those treated with rotted manure.

It was evident from the experiments as a whole, that the amount of manure applied (10 tons per acre in a 4-year rotation) was not sufficient to maintain the productiveness of the soil, although the yields were always better where manure was used, and it was observed that in case of corn the stand was better on manured than on unmanured soil.

A strife is on between raisin growers at Selma, members of the Selma Fruit Company, and the raisin packers combine by which the combine hopes to force the Selma people to release control of the Elliott raisin seeding plant.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.

HOW AND WHY
De Laval
CREAM SEPARATORS
ARE SWEEPING THE FIELD

On June 1st a creamery skimming station four miles from Milton, Wis., closed its doors. Thirty-two farmers had been having their milk skimmed there. When the station closed they were compelled to buy their own separators. Thirty-one of them bought DE LAVAL machines, notwithstanding agents of eight different makes of separators were on the scene hot after the business. This is only a fair example of how the 1908 improved DE LAVAL is making a "clean sweep" of the separator business in every dairying section from the Atlantic to the Pacific.

The De Laval factory has been working every available man night and day since early in February and is now more than 2000 machines behind orders, so great has been the demand for the new and improved machines.

The 1908 DE LAVAL machines are simply so overwhelmingly superior in every way to anything else in the shape of a cream separator that it is only natural that well informed buyers everywhere will have nothing else. They are beautiful in design, perfect in construction, and everlasting in daily use. They are made in ten new styles and ten new capacities, with a size for every dairy from the smallest to the largest, and are sold at ten new prices that are just right and much the cheapest of all for the value given.

A new 1908 catalogue, constituting a separator education in itself, and any desired particulars are to be had for the mere asking.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 22, 23.

FILL UP THE IDLE CORNERS.

When financial conditions are as they are now, and especially when a dry year reminds us of the hard times, it will be well for the farmer to ask himself the question as to wherein he can make his ranch more productive. In other words, how can the soil be made to bring forth more money at the end of the season. We know that many fruit growers with their one or two or three cows often buy every bit of the feed consumed by the stock, thinking their land too valuable for fruit growing to use any part of it for green crops. But we are sure that with the return of fertility which is used up by corn, pumpkins or some root crop, that much help may be secured from waste corners of the ranch. Every little bit helps out in a dry year.

HAS CO-OPERATION SUCCEEDED?

The approach of the end of the orange shipping season leads the growers to look back over the season and to compare with other seasons. This has perhaps not reached quite the high water mark of last year; that is, as to prices, but the greater output will probably make up in total return equivalent to that of last year.

The year 1906-07 was by far the best the orange industry of this State ever saw, and it is probable but few will ever reach as satisfactory a net return as was given to the orange growers that year. In fact, if every year were to be as profitable as last year our orange growers would have difficulty in preserving the present tariff on oranges.

But if given reasonable treatment by the country at large, it is plain the citrus industry is now on a footing from which it will never be dislodged.

This, we believe, is due more to co-operation and intelligent methods of fruit growers disposing of their own fruit than to any other one factor. Long may this great co-operative movement live and may its truth be proclaimed until it shall bring the same degree of prosperity to growers of other products in this State.

SEED MEN SHOULD BE CAREFUL.

We do not know regarding the merits of a case recently tried in the courts of Orange county, wherein a farmer was awarded $2000 damages because seed which he purchased was not true to name, but assume that the decision of the twelve men "good and true" was just.

The farmer had bought beardless barley sufficient for 250 acres of land. The harvest time showed it to be the ordinary bearded barley, which yielded less and sold for less than would have been secured for the beardless variety. The grain grower sued for $4050. The jury evidently figured that the actual damage was $2000 and so awarded.

We realize the difficulty which seedmen labor under in the number of hands which their product passes through before it is passed on to the grower, but greatest care should surely be exercised to protect an innocent purchaser. The loss the country over from impure seed, that is, seed which has objectionable weed seed mixed and from imperfect seed as well as from cases like this where substitution, either by error or otherwise is made, is something awful to contemplate.

We assume this verdict is just and in many cases sincerely hope that all seedmen will take greatest pains to correct the evil which has been most perplexing to farmers and gardeners.

ALEXANDER CRAW.

Alexander Craw is dead. One of the most genial, most pleasing of gentlemen to meet and, as well, one of the most competent and successful of men. For years he watched the interests of California fruit growers as deputy under the State Board of Horticulture at the port of San Francisco. His integrity and abilities were recognized by all and especially by the Hawaiians, who took him away at more than double the salary this State felt able to pay.

As Horticultural Commissioner of the Hawaiian Islands, his services have been invaluable to the fruit and agricultural interests of these islands and to this country as well.

A few months ago he returned to California hoping to recover failing health. He first tried Southern California then went to Madera county where he died at the home of his brother-in-law and was buried in Evergreen Cemetery, Los Angeles, on Tuesday.

FOR PROTECTION OF CITRUS FRUITS.

The citrus growers of this State are taking time to prepare for the coming tariff revision and are proposing to ask for an increase of one-half cent per pound on all citrus fruits. The Citrus Protection League is at the forefront of the movement and its efforts will be seconded by all citrus growers.

There is a hundred million of dollars invested in the citrus industry, and the power of production of a great fertile section of this State is worthy of greater protection from the inroads which have been made by Mediterranean fruit this year. An enthusiastic meeting was held in Los Angeles on Tuesday and the first steps toward this added protection were taken.

Farmers, merchants, producers, shippers and business men, who are interested in the aproaching tariff revision, a subject on which the committee on ways and means, of Congress, will give a thorough hearing next November, are invited to atend a two-day conference Thursday and Friday, July 16 and 17, at California Building, Union Square, San Francisco.

Steps will be taken at this meeting to formulate a concerted plan of action so that California may be promptly represented when the hearing is held.

NAME THE FARM.

The first list of farm names appears on another page this week. The Cultivator will be pleased to have the name of every ranch in California. Send in the name to be added to the published list. If it hasn't a name make one. Make it descriptive of the ranch or let it show the character of its products if possible. In any case let it be euphonious and attractive as possible.

Letterheads and envelopes with farm names are also desirable. A small, well-painted or gold leaf board at the entrance with the name gives added value and fixes the name on the minds of others.

LOOKS ARE RUINED,

Farms, otherwise pretty, are often ruined, so far as looks are concerned, by invitations to drink Dr. Gambrinus' sure cure for disordered stomach. Mr. Pretender's Pale Pills for Pink People, or Madam's Concoction for correcting the complexion. Then come urgent solicitations to "smoke only the bulowhango," to drink only the "peregrinating purgative pellets," to rest your hopes on the mysteries of Dr. Miserarium's Marvelous Medicamentum. Letters ten feet high, in strings a hundred yards long, dashed on by an idiot with a big brush and a paint pot, stare at one like the red eyeballs of dancing demons in Dante's Inferno. You can't escape them. Look east, they are there; look west, they are there; look up, you see them; look down, they are still with you. Neither house, nor barn, nor fence, nor tree, nor hedge is safe. The very roadway is carved with the nerve-racking, strabismus producing spectacle, until the distracted traveler is forced to shut his eyes to country scenes and shut himself up like a clam in the car.—American Farmer.

Whatever you grow let it be the best of its kind. However you pack it let it be honestly packed, as good at the bottom as at the top of sack or box. With it all let the packing be as attractive as possible.

Shop Talk

FARM BOOKS.—When space will permit, we intend printing, in another column, a selected list of books devoted to the different departments of ranching. Most of the **Cultivator** readers are on the Pacific Coast, so the list is chosen with regard to their adaptation to California conditions. We take the responsibility of recommending these books and will receive orders at the regular price to be delivered free of other expense. Any which may be desired and which do not appear in the list, we will be glad to have mentioned, and if possible, they will be obtained at the regular price.

Every rancher's library, however small, should contain one or more standard books of reference devoted to subjects of greatest interest to him. From those not supplied, we shall expect many orders.

CANDY BOOK.—We are still sending the Candy Book. To those renewing their subscription and sending us an amount to cover a full year in advance, we are mailing, on request, the book of recipes for ice cream and candy making. It contains over 300 formulas and sells regularly for 50 cents, and is proving a very attractive inducement to renew promptly. Do it today and please the family, but don't forget that payment must be for a full year in advance from the date sent.

SUBSCRIPTIONS.—We find it desirable to occasionally mention to our new readers the matter of notifying when subscriptions are to be discontinued. Old **Cultivator** subscribers do not want their files broken by their neglect to remit promptly, so it is our custom to continue all subscriptions until notified otherwise. Every paper shows the date of expiration on the address label and every one should keep posted as to how their acount stands. For instance, should the tag read 7-08 the subscription is paid to July 1, 1908. Agents visit nearly every section each year to collect renewals, but in the event of their missing any, notice will be mailed from the office, in which case we expect remittance direct. In case of any error, prompt advice should be given us so that correction can be made.

Agricultural Notes of the Pacific Coast

Northern California

Marysville ships a car of cucumbers daily now.

All Northern California will have a heavy crop of fruit.

Peaches and almonds near Live Oak will run an exceedingly heavy crop.

Vacaville has shipped nearly 200 cars of deciduous green fruits to date.

Apricot drying is in full swing in some sections of the Sacramento valley.

Santa Rosa cannery is putting up large quantities of berries and cherries.

Cloverdale viticulturists recently met and discussed matters of the industry.

Lodi will exhibit some of ner fine beries and grapes at the Alaska-Yukon Exposition.

One hundred and seventy-five tons of alfalfa were recently burned in a fire at Dixon.

State Veterinarian Keane reports that about 3,000,000 sheep have been dipped in this State.

It is estimated that the price of prunes will be much less than the short crop would indicate.

Sonoma county hay crop is lighter than usual, but with all will be a fairly good yield.

Farmers at Woodland are asking for a highway that will save a three-mile haul of the produce.

Contra Costa county pear growers are greatly exercised over the destruction wrought by the thrips.

Humboldt county still has an ox team hauling ties to the railroad, similar to the good olden times.

The rainfall for May at Nevada City aggregated 4.50 inches. This is the greatest precipitation since 1864.

United States Geological Survey is about to enter the Humboldt to test the quality of the water supply of that section.

Sebastopol producers are finding the free market of San Francisco a satisfactory place for the disposal of produce.

G. Harold Powell and his corps of helpers are in Northern California investigating apple and other fruit shipping losses.

Fruit buyers in Sutter county are offering as high as $25 per ton for cling peaches, but growers are holding for a higher price.

A century plant in Colusa county has been sending up a bloom stalk, which it is claimed, made a growth of one foot per day.

The Sonoma County Co-operative Poultry Association is appealing for 500 more members from amongst the poultrymen of that county and asserts that if it can have this increase it can effectually control the market situation.

The Butte County Citrus Association recently met and elected the following Board of Directors: J. A. Lawrence, G. W. Miller, E. W. Fogg, J. F. Fitzgerald, Alex Bartley, R. F. Powers and Wesley Dial. Miller represents Wyandotte, Fitzgerald represents Palermo, and Bartley and Dial represent Thermalito. Lawrence was elected president, Dial was named for vice-president and J. H. Anderson was elected secretary.

Central California

Santa Cruz held a dog show recently.

Sugar beets at Corcoran are making a fine showing.

Field and forest fires are already destroying much property.

The Atwater cannery will handle about 200 tons of apricots.

Bakersfield has just liberated a large colony of comys fusca.

Capitola has a plant for the manufacture of jellies and marmalade.

Fresno is taking an active part in the creation of better roads.

Turlock says that the almond trees are promising a bumper crop for this year.

Turlock acreage of sweet potatoes will be larger this year than ever in its history.

Shippers of early cherries from Santa Clara valley received magnificent returns.

Owing to dry spring Turlock strawberries are yielding lighter than formerly.

The cannery at Stockton is employing at this writing about 600 men and women putting up the fruit.

California shipped more fresh deciduous fruits to the East this season than ever before in her history.

Contract has been let for the construction of a new packing house at Watsonville. It is to be 56x170.

Turlock claims that its output of apricots will be more than ten times greater this year than ever before.

Fruit growers near San Jose have been offered $28 per green ton for prunes, and apricots sold for about $20.

It is expected California will produce this year about 500,000 tons of barley, and its value will exceed $12,500,000.

The Port Costa warehouses contain about 8787 tons of wheat, while on the same date last year they held 17,162 tons.

A boy in Visalia has shown a streak of enterprise by attempting to breed coyotes in order to secure bounty on their scalps.

Stockton warehouses are practically empty of all grain, which condition has not confronted them before in many years.

Sanger has recently acquired a new fruit company, and now has three packing houses handling green fruit and two handling dried fruits.

Bakersfield is planning for the holding of a fair this fall, and has just organized a committee to take up the preliminary work of establishing a fair association.

A car of oranges shipped from Southern California to Visalia was denied entrance because of the fact that it was claimed to be infested with yellow and red scale.

Some little contention has prevailed between three ditch companies over the waters of the Kings river. The waters are so low this season that every fellow wants "his share."

The Lindsay Gazette mentions an orchard which netted $1908 this year. May be, but we think there are some other qualifying factors which should be given to form an intelligent opinion.

Southern California

Navels are all shipped in Southern California.

Chili pepper acreage will be much smaller than last year.

A bumper apricot crop is reported from most fruit growing sections.

Imperial valley has already shipped over a thousand cars of cantaloupes.

This year's walnut crop will be the best in ten years, says the Orange County Tribune.

Gifford Pinchot will soon be in Southern California and will inspect the forest reserves.

Apricot cutting for drying will begin about the 1st or 5th of July in Southern California.

Six cattle have died as a result of dipping for Texas fever tick in Trabuca canyon recently.

The quarterly meeting of the Tri-Counties Reforestation Committee is being held in Santa Ana today.

Fullerton shipped 100 carloads less cabbages this year than last, and the prices were very unsatisfactory.

Fullerton cabbage growers netted $12.00 per ton last year for cabbages, and less than $5.00 per ton this year.

Hay fields about Fullerton have yielded an immense crop and work is just beginning on gathering grain.

The sugar factory to be erected at Santa Ana will have a length of about 300 feet and will be four stories high.

Los Alamitos sugar beets are doing exceedingly well and the warm weather has been inducing earlier ripening.

Imperial valley cantaloupes in a swell hotel in New York were put down on the menu as 65 cents for a whole and 35 cents for a half.

The San Bernardino Daily Sun says that since the warm weather began that it is easy to hear the oranges grunt as their little green hides stretch.

Santa Ana Register urges ranchers to plant the stray corners of their places to some kind of forage crop to make up for the shortage of hay this dry year.

The close of the navel orange season finds orange growers well satisfied with the returns, though at this writing Valencias are not commanding last year's prices.

Orange county acreage of celery will be shorter than anticipated, owing to many celery growers being turned to beet growing, and to the further fact that there is a shortage of plants.

The highest average received by any Redlands packing house this year for navel oranges is $1.80 per cwt for all fruit reecived. The average of all the houses of Redlands will approximate $1.60 per cwt.

The automobile surely has diverse uses as is proved by walnut growers of Orange county who have rigged up a walnut-gathering machine which takes from the ground hulls and separates waste and sacks walnuts.

Coachella valley farmers are anticipating the arrival of alfalfa seed to be introduced from the Sahara Desert. It wil be used in the paper making industry of Southern California, if it succeeds under Coachella conditions.

The Coast

The live stock show is to be held in Portland September 21 to 26.

Florence, Oregon, recently held a rhododendron carnival.

Prospects are good for a good crop of berries at Coeur D'Alene, Idaho.

Many sales of wool in Northern Idaho have ranged from 8 to 13 cents.

Farmers near Walla Walla, Washington, are short for help to market crops.

The Farmers' Union at Grangeville, Idaho, has ordered its sacks for the coming grain crop.

Ground has been broken for an immense warehouse to be built at Volmer, Idaho.

The third annual cherry fair and carnival will be held at Salem, Oregon, July 10 and 11.

The State fair grounds at Salem, Oregon, are to have an addition of a $4000 grand stand.

Dairy cattle were never so scarce as at the present time in the State of Oregon.

Pullman, Washington, plans the greatest horse show in its history this month.

Farms near Bellingham, Washington, have been overflowed, causing much damage.

Over half a million pounds of wool changed hands at Idaho in one day early in June.

A million lambs are to be handled through one stock yards of Denver.

After long continued rains Pullman, Washington, farmers are rejoicing over sunshine.

Four hundred and twenty-five thousand fruit trees have been set out in Northern Idaho in the past season.

A Pendleton, Oregon, man has lost 250 head of sheep from eating poisonous weed. It is a lupine or wild pea.

The Granite Reef dam in the Salt River Valley, Arizona, has just been completed. It is a thousand feet long.

A sale of school lands belonging to Washington State College at Brewster recently sold at auction at $30 per acre.

Colorado farmers are finding, to the surprise of many of them, that corn is proving a remarkably profitable crop for that State.

Spokane county farmers are planning for the handling of grain in bulk instead of buying it in sacks as heretofore.

Wheat crops near Weston, Oregon, have been greatly injured by the rust which has been exceptionally bad this year.

Over 880,000 sheep in Oregon have been inspected for scab. Only 7000 were found to be affected with this pest.

At a Spokane county convention of the Farmers' Union recently held at Waverly it was decided that "sacks must go" and that bulk handling of grain must be adopted.

The State veterinarian of Oregon has ordered that all horses affected with mange should be dipped. This disease is prevalent amongst hundreds of Indian horses on the forest reservation.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Coulson's Cresolene

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company
Petaluma, California
Germain Seed Co., Los Angeles, Distributing Agents for So. Cal.

Little Chicks should be fed on Excelsior Chick Food

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

Excelsior Cereal Milling Company

242 Central Ave., Los Angeles

Black Langshans Well, we won again at Los Angeles. Two firsts, one second, one third on five birds shown. Best stock ever in show room in California. Eggs, $2.00 to $5.00 per 13, $10.00 to $20.00 per 100.

White Rocks Large and vigorous. Improve your stock with a setting or get a fine flock with an incubator lot. Eggs, $1.50 to $2.50 per 13, $8.00 to $12.00 per 100.

S. C. White Leghorns Order eggs now, we have plenty of them. Have had all winter, great big white ones. Eggs, $1.00 to $2.00 per 13, $6.00 to $10.00 per 100.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FRUIT AND POULTRY.

FRUIT growing makes an excellent combination with poultry raising. By this combination one is able to secure two crops from the same land; the soil is improved by the poultry droppings, insects are kept in check and the soil under the trees kept loose by the hens. On the other hand, the trees furnish abundant shade, which is so essential to poultry during our California summers. Where one has a small orchard and wishes to run poultry in the same, it is a good plan to fence the entire orchard with chicken wire. By this method the fence does not interfere with the cultivating of the orchard; it prevents neighbor's hens from ranging on your land and thus the chances of outbreak of contagious diseases is diminished.

It enables us to use colony houses in the orchard. These houses may be inexpensive and of a size that renders it easy to move them. A house four by six feet with walls covered with shakes, makes a light, airy house for fifteen or twenty hens; this can be moved frequently and thus be on fresh ground at all times. The roosts should be movable, and by painting inside with crude oil two or three times a year, mites can be kept down. By using the hopper method of feeding in connection with this, colony house labor may be reduced to the lowest amount consistent with profitable returns. By this system of handling fowls, if the place is once free from contagious disesases, it can be kept free. The birds have plenty of range and exercise, consequently keep in a vigorous, healthy condition. One of the factors that causes so many failures in the poultry business is the amount of labor required to tend the fowls. By this system labor and outlay are reduced to the lowest possible figure, and meat and eggs are produced at a minimum cost.

INTERESTING EGG RECORDS.

For some years past the Hawksbury Agricultural College of New South Wales has each year been conducting competitive egg laying tests. These tests have aroused much interest not only in England and the Colonies, but in the United States, and many pens of birds have been entered from America from time to time. The number of birds in an entry have been limited to six pullets, not less than six months old nor more than twelve; no roosters were allowed with the pens. The conditions under which these birds were kept were of the simplest nature and easily duplicated on any farm or ranch. Bran entered largely into all mashes. For whole grain corn and wheat were fed. Meat was fed and an abundant supply of green food was provided. The houses were open front covered with wire. The roof and walls weather proof; ventilators were provided at the back of the house just above the floor, so fresh air passed under the hens at all times. The floor space was five and one-half by six feet for six hens and the runs seventeen by eighty-seven feet.

They were fed mash in the morning and whole grain at night. The writer speaks in praise of corn as an ingredient of poultry rations.

The tests continued twelve months, and a recent one gave results as follows for the number of eggs per hen yearly:

6	White Rocks average per hen	124 eggs
6	Brown Leghorns	178 "
6	Rhode Island Reds	176 "
96	White Leghorns	166 "
12	Buff Wyandottes	155 "
36	White Wyandottes	151 "
60	Buff Orpingtons	143 "
24	Minorcas	131 "
18	Langshans	131 "

At an average price of twenty-four cents per dozen the Brown Leghorns gave a gross return of $3.56 per hen, leaving a net return of $2.25 per hen, while the Buff Wyandottes gave a gross of $3.10 leaving a net of $1.60.

In this test the Minorcas and White Rocks fell down badly and this illustrates the point that the strain of a breed is a very important factor in selecting utility birds. If White Rocks or any other breed have been bred for egg production for several generations they will give much better account of themselves in a test of this character than birds of the same breed bred purely for show room records.

FEEDING YOUNG CHICKS.

A writer in the Western Farmer recommends the following method of feeding small chickens when confined in brooders and small yards:

First clean the floor of the brooder and cover it with cracked grain or chick food which should contain a small quantity of small chick grit, next finely cut litter is spread over this, then another layer of chick food; continue this process until the litter is five or six inches deep. Chicks a week old or less may be placed on this and not fed again until the supply is exhausted. Instead of the old plan of feeding several times a day you are compelled to feed only once in several days. After this supply is exhausted a new litter and new food is provided as before. The amount of food given and the length of time it will last depends, of course, on the number of chicks to the pen and the age of the chicks. This litter is put on the floor of the exercising apartment of the brooder or the floor of the brooder house. In this manner the chickens are compeled to dig out their own living, which exercise is most beneficial.

BEEF SCRAPS.

Beef scraps are made from the waste meat of the cattle slaughtered in the packing houses. This meat is cooked by steam and after it has been thoroughly dried with hot air, it is coarsely ground. In this condition it will keep for months in a cool place. It is a valuable addition to the mash fed poultry. A good sample contains about sixty per cent of nitrogenous food, or protein. It cost from three dollars to three dollars and fifty cents per hundred pounds. Many poultrymen who feed dry mash in hoppers feed the meat in a separate hopper allowing the hens to help themselves. I find this a very satisfactory method.

An excellent mixture for laying hens is made as follows: Bran, 60

pounds; middlings, 20; rolled barley, 20; feed meal, 12; fine beef scrap, 12; charcoal, ½ pound. This may be put in the hopper and the hens allowed to help themselves to the mixture.—S. S. T.

POULTRY BREVITIES.

Don't feed small chicks wet food.

* * *

Never allow incubator chicks to become chilled. One-half the ills of young chickens arise from this cause.

* * *

Give your buff birds plenty of shade if you want a good buff color. They fade under the influence of the hot sun.

* * *

Chicks hatched from eggs laid by stock that is immature, unhealthy or improperly cared for, are raised with difficulty.

* * *

The census of 1870 gave an average of 30 eggs per hen per annum in the United States. The census of 1900 gave an average of 70 eggs per hen. In the thirty years the average had been doubled per hen.

* * *

Roup and Fleas.

I have a small flock of Buff Orpingtons which I keep in a small yard. Three or four of the best ones are suffering with swollen eyes, and often times pus forms. Can you suggest a remedy?—H. M.

The trouble is often due to roup and again hen's fleas may cause it by burrowing into the flesh about the eyes. If it is due to roup the head of the fowl will have the offensive odor that accompanies attacks of this disease. If you find this to be the case, remove the sick birds and disinfect the feathers and treat the sick birds for roup.

If due to fleas, clean the wound and dress with an ointment of one part iodoform and sixteen parts of vaseline.

* * *

Mites.

Will you please tell me through the columns of the Cultivator what is the trouble with my chickens? They seem to be healthy, but lose their feathers and the skin is red and inflamed. I often find on the feathers a small insect resembling a mite.—E. R. J.

Probably the birds are infested with the depluming mite. This insect works at the base of the feathers causing them to fall out and leaving the skin red and inflamed. I know of no better treatment than the application of carbolated vaseline to the affected parts. Take an ounce of vaseline, add thirty drops of carbolic acid and mix thoroughly and apply as needed.

* * *

Limber-neck.

Will you kindly give me some aid in way of suggestions as to what is the matter with my Leghorns? I have one hundred White Leghorns hatched in the spring of 1907. They were well cared for as chickens and began laying in September and October, and have laid fairly well up to the present time.

But in this flock I have had several cases of a most puzzling nature. The trouble seems to be in the neck; oftentimes the bird cannot raise its head again; the neck may be turned back upon the body, but in all cases the trouble seems to be in the neck.—E. S. G.

Your birds are suffering from what is known as limber neck. It is due to disorder of the nervous system, and is usually caused by disturbances of the digestive system from severe attacks of indigestion or from worms.

Feed on dry food. See that they are well supplied with grit and charcoal. Add a teaspoonful of tincture of nux vomica to two quarts of drinking water. Give the sick bird a small piece of gum of asafoetida about the size of a small bean. Repeat the dose the next day. This will prove effective in many cases.

Judicious feeding and abundant exercise is the preventive of this trouble.

ONE OF THE ABLEST.

Speaking of Dr. S. S. Twombly joining the Cultivator staff, the Deseret Farmer published at Salt Lake City says:

The doctor was one of the best informed and ablest instructors that ever came into Utah and the "Farmer" rejoices in the success that is coming to him in his California home. When Dr. Twombly left Utah, the Agriculture College lost one of the ablest men that has ever been on its staff. The writer was a student and personal friend of Dr. Twombly and takes pleasure in congratulating him on his new position.

BREEDING LAYERS.

Michael K. Boyer, writing in the Orange Judd Farmer, gives a bit of experience with trap nest that is interesting. He states that he can attend to twenty-five trap nests in ten minutes of each hour from ten o'clock in the morning until three in the afternoon. This is less than one hour a day for the 172 hens under inspection.

He found that during January of the year the test was made he had sixty-five hens which laid in February 115, in March 165, in April 156, in May 147, in June 126, in July 132, in August 108, in September 74, in October 18, in November 26, in December 59. During eleven months these sixty-five hens laid 1126 eggs or five per cent of the possible number. The test showed that seven hens did not lay an egg, only twenty-three laid between 100 and 150 eggs. Eighty of the lot failed to reach sixty eggs in the year. One hen, the finest marked hen in the lot, laid only 13 eggs.

The second season Mr. Boyer made up a pen of hens all of which had laid more than 100 eggs the year before. As a result he got an average of 120 eggs per hen. Since that time he has continued to select his best hens by the use of trap nests, and his flock now makes a record of from 120 to 180 eggs. A few as high as 200 eggs.

The advantages of the trap nest are summed up as follows: Egg eaters are detected, hens laying badly shaped eggs are known. He knows the hens that lay the most fertile eggs and in handling the birds so frequently he is familiar with their condition, and if they are not right can use preventive measures to stop the course of disease and at the same time keep them free from parasites.

The man who sticks to one breed from year to year, through all its ups and downs, is certain in the long run to enjoy the fruits of his constancy.

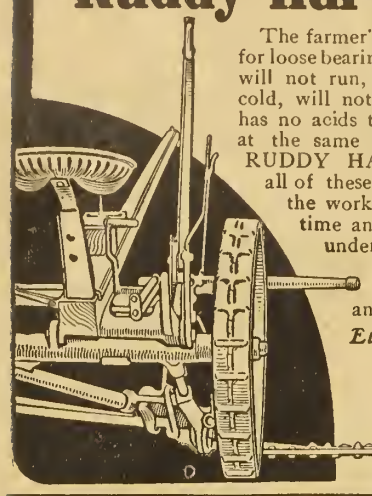
Ruddy Harvester Oil



The farmer's needs demand a heavy oil for loose bearings, one that will work freely, will not run, is not affected by heat or cold, will not gum or grow rancid, that has no acids to injure the bearings and is at the same time economical to use. RUDDY HARVESTER OIL answers all of these requirements and lightens the work of the horses, saving their time and strength. It works perfectly under all conditions and in any weather, and is just as good for all sorts of farm implements as for harvesting machinery. In one gallon and five gallon cans, half-barrels and barrels.

Every dealer in farm supplies carries it in stock.

STANDARD OIL COMPANY
(Incorporated)

ALFALFA — $3298.00

ONE SEASON'S EARNINGS

It will pay every Farmer who reads this "Ad" to write us especially if interested in Clover or Alfalfa growing. We can refer you to a man who made $3298.00 in Alfalfa last year.

HE WILL TELL YOU HOW IT WAS DONE

We manufacture the machine shown in the cut; it threshes, separates, hulls, and cleans ALL the seed for market. No other machine will do it. You should write us and get our Alfalfa Booklet FREE. It will give you valuable information. Mention this paper.

Makers of Rubber Sanded and Rubber Flexine Roofing and Refiners of Asphaltum

A NEW IMPERIAL.

An event to take place within the next few months that will prove of the utmost importance and interest to the farmers and homeseekers throughout the United States and Canada, is the opening up for settlers of the valley of the Yaqui river.

This valley lies on the eastern coast of the Gulf of Lower California, about 275 miles south of the boundary line of the United States, and is on the Yaqui river division of the Southern Pacific Railway. The soil and climatic conditions are almost identical with those of the now world famous Imperial valley.

The work of taking the water out of the Yaqui river and distributing it over the 550,000 acres of land that comprise this valley is being rapidly pushed to completion and the owners expect to be able to offer the land to small investors late in the fall or early winter.

Owing to the fact that a great many thousand dollars are needed to complete these developments, it has been decided to offer a few thousand acres in large tracts of not less than 1000 acres each, at a price that will attract both speculators and the more conservative investors. It will be possible for the next 60 days, to buy 1000 acres at $12.50 per acre, and this price will include a permanent water right entitling the owner to use such water as he may require, at the rate of 50 cents per acre foot. O. A. Vickrey & Company, 308 South Hill street, have been appointed sole selling agents. Any further information may be obtained at their offices.

DIVIDEND NOTICE.

San Francisco Savings Union. N. W. Cor. California and Montgomery streets.

For the half year endlng June 30th, 1908, a dividend has been declared at the rates per annum of four and one-quarter (4¼) per cent on term deposits and four (4) per cent on ordinary deposits, free of taxes, payable on and after Wednesday, July 1st, 1908.

Depositors are entitled to draw their dividends at any time during the succeeding half year. A dividend not drawn will be added to the deposit account, become a part thereof and earn dividend from July 1st.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The Savings and Loan Society. 101 Montgomery St., Corner Sutter St., San Francisco.

For the half year ending June 30, 1908, a dividend has been declared at the rate of 4 per cent per annum on all deposits, free of taxes, payable on and after Wednesday, July 1, 1908. Dividends not called for are added to and bear the same rate of interest as the principal from July 1, 1908.

WM. A. BOSTON, Cashier.

NO CHANCE.

"Do you consider marrlage a lottery?" asked the coy young widow.

"Not so you could notice it without a pair of green spectacles," replied the fussy old bachelor. "It's more on the order of a shell game."—Chicago News.

California Farm Names

A LITTLE poetry, a little sentiment, added to farm life gives a bit of spice and brightens up some the dull spots in the daily routine. There are dull days and there is dulling labor, or at least labor which we sometimes think is bringing us to be a typical "man with the hoe" or "woman with the broom." That is true in the largest city as well as on the farm. The boy fresh from the work behind the plow, or with the hoe, visits the city and the rush and whirl and attractive outward veneer looks dazzling to him and he little thinks that in many a dingy office or shop, the dull plodding work is being done with even more doggedness and determination than ever on the farm. The hard grind is always there. But the gala day appearance appeals slightly to the tired man of the office, and if he is given a day off an immediate start is made for seaside or the fields. Why? Because of their natural attractiveness to every human being.

Let us add to that attractiveness by planting more trees, keeping neater roadsides and caring for the front lawn and making our communities so that people of the city will love to drive past them.

When this beautifying is done, or while it is being done, let us dignify the place, the home, by giving it a name. It's worth it. If it isn't, make it worth it.

* * *

We have been talking of this for some time and now have a few names which have been sent in. Some have been sent in with reason for selection of name and an idea of productions of the ranch.

This is good and we hope the names will continue to come. Give us another installment for next week, or at least, by the week after, and we will have an interesting department of the paper and incidentally add a touch of sentiment to farm life that may prove of commercial value.

The following are the names sent in up to this time:

"Minnetonka," owner, Chauncey S. Sheldon, Lordsburg, California.

"Tanglewood Farm," owners, Mr. and Mrs. J. H. Goodier, Maywood Colony, Corning, California.

"Vineclad Farm," owner, Geo. D. Lee, Central Avenue, Compton, California.

"Loma de Luz Orchard," owner, O. M. Prickett, Alma, California.

"Dunwoodie," owner, James Scott, Los Banos, Merced county, California.

"Quail Hollow," owner, William Richard, Eccles, Santa Cruz county, California.

"El Guernsey Rancho," owner, E. G. Webb, Fresno, California.

"Merlin Villa," owner, Mrs. J. Lenert, Chino, California.

"Enterprise Jersey Farm and Nurseries," owners, Tribble Brothers, Elk Grove, California.

"Nuthurst," owner, J. F. Unruh, El Monte, California. Twenty acres of walnut grove.

"Greenwood Ranch," owner, C. E. Garrett, Hynes, California. Had letter heads printed, which is a very attractive idea.

"Rose Hill Bee Farm," owner, August Soderquist, Turlock, California. Thinks it a very good plan, as it aids in advertising a place and its products.

"Paramount Ranch," owner, J. H. Miller & Sons, Ritchey, California. It is a fruit and nut ranch, situated about eight miles from Ione. This year prunes made about a third of a crop, and apricots, peaches and almonds did well. Apricot drying has commenced.

"Tesoro Rancho," owner, A. S. Bradford, Placentia, Orange county, California. It has gone by this name for seventeen years.

"Central Avenue Grapery," owner, J. L. Winniger, Compton, California. This farm is situated about ten miles south of the Los Angeles court house. The name of the ranch and of the owner is in large letters on a bulletin board in front of house.

ALEXANDER CRAW VERY ILL.

This item was written by Mr. Isaac after a visit with Mr. Craw in Madera county, and was in type before his death. He was buried in Evergreen Cemetery, Los Angeles, last Tuesday.

The friends of Alexander Craw, and their names are legion, and include every fruit grower in California and every man with whom he ever came in contact, will regret to learn that he is now lying very low, with little hope of recovery, at the home of his brother-in-law, Mr. Frank Femmons, at Home Orchard, in Madera county. Mr. Craw, who has been in the employ of the Hawaiian government for the past four years, came to his home in California for his health some three months since, and stayed for some time at the sanitorium at Glennwood, in this county. He seemed to improve rapidly while here, and was soon able to remove to Home Orchard where it was hoped that the pure mountain air and peaceful surroundings would hasten his convalescence. He improved for some little time, but suffered a relapse, and it is now feared that there is little if any hope for his recovery. Mr. Craw was for many years connected with the State Board of Horticulture, and his conscientious and efficient work here attracted attention from the whole world, and his name is known in entomological circles everywhere. He was finally induced to accept a liberal offer from the Hawaiian government and severed his connection with California, only to return when failing health caused him to turn longing eyes to the State he has so long honored and loved.

COMPERE WILL BE RETAINED.

Newspaper rumors have had it that George Compere, who has been engaged in the work of searching for parasites for the State for several years past, was to be dismissed upon his return from his last trip. Mr. Compere is now in California again, having returned from China and India, bringing with him a number of beneficial insects, among them what in its native country is a most efficient parasite of the mealy bug. In regard to the newspaper reports, Mr. Jeffrey, the State Commissioner of Horticulture, states that they were without foundation, and that instead of dispensing with Compere's services it is his intention to broaden his sphere of activity and bring the California office into close touch with the entomologists of the world. During his stay in California, plans will be made with Compere to this end, and it is hoped and believed that his work will be more effective and beneficial than ever.

Resistant Eucalypts

THE Arizona Experiment Station issued recently a circular on eucalypts, which has much of interest, so that we quote largely from it:

The importance which this remarkable genus is assuming in parts of California as a producer of wood that can be turned to a variety of purposes, together with the similarity of the agricultural valleys of Southern Arizona and certain interior ones of California where the trees are grown successfully, is responsible largely for a growing interest. On account of the marvelous growth of eucalypts which enables the California planter to net handsome profits from his groves, it is only natural that their planting should be given consideration here.

If the most drouth-resistant varieties of eucalypt trees are once well established during a period of wet years, or better yet by means of moderate irrigation, there appears to be good cause to believe that they may be grown successfully with limited irrigation on lands that are of secondary value for cultural purposes at the present time on acount of limited water supply. Also waste pieces of land about the farm, borders of ditch banks, and even roadsides, might well be planted with these useful trees.

Examples are known of small groups of eucalyptus trees growing in valley lands, which are usually deep and alluvial in nature, for periods of six to ten years without irrigation. Not infrequently the underflow in these valleys is within reach of these deep-rooting trees, which undoubtedly explains in part their ability to grow under such extremely arid conditions. However, the writer would warn the practical planter not to expect too much from trees growing with a limted water supply.

In addition to the possible economic value of eucalypts, several varieties have shown themselves to be valuable additions to our list of shade and ornamental trees. As ornamentals they are evergreen, which is a desirable feature in a region with as little color as our own, and possessed of a pleasing aroma. They have thus far been found free from fungus and insect pests, and unlike deciduous trees do not cost a litter of fallen leaves each year; although some of them shed considerable bark.

Eucalypts to grow in the warmer parts of Arizona must be able to endure maximum temperatures from 108 degrees to 120 degrees F. with low humidity and intense sunlight, and also survive ten to twenty degrees of frost in winter. It will be interesting to note that almost without exception the varieties that are capable of growing under a wide range of conditions in California are the identical ones that succeed best with us. Except in sheltered situations, it remains to be seen whether any of the species can be grown with success at altitudes above 2800 to 3000 feet.

The species that have been found to withstand best the above conditions are the forest red gum, Eucalyptus tereticornis; red gum, E. rostrata; desert gum, E. rudis; red box, E. polyanthema; narow-leaved ironbark, E. creba; and manna gum, E. viminalis. According to Professor McClatchie sugar gum, Eucalyptus cornyocalyx; white gum, E. leucoxylon; and gray bark, E. hemipholia, grow successfully at Yuma and Phoenix; and there is even a possibility that blue gum, Eucalyptus globulus, will survive in the mildest situations near Yuma. With further study other species will undoubtedly be found that will resist equally well our heat, aridity and cold.

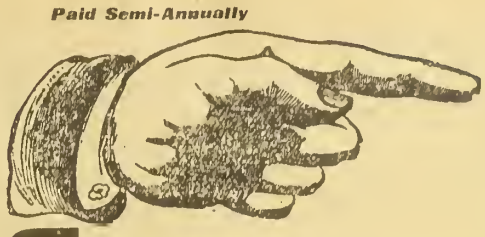
Forest red gum, Eucalyptus tereticornis, is a rapid-growing tree, and considered valuable in Australia for its lumber. When planted near together the trees become tall and erect with uniform trunks, while if scattered they are likely to grow stocky and branched. A small clump of this species is growing in the Santa Cruz valley three miles northwest of Tucson. These have never suffered any injury from our wide range of temperatures. It is stated that they have not been irrigated during the past six years. At this time they are about twelve years old and the taller ones range from fifty-five to seventy feet high with trunk diameters fourteen to seventeen inches.

Red gum, Eucalyptus rostrata, is quite similar in appearance to the last species, being nearly related botanically. Though it is thought to be less drouth-resistant than the forest red gum it is apparently equally resistant to our temperature extremes. Its growth is rapid, though somewhat variable, some trees being tall and straight, others irregular. In Australia it is considered one of the most valuable of eucalypts on account of the extreme durability of its wood. It is being much planted in parts of California at this time. Professor McClatchie recommends the red gum very highly in his bulletin on eucalypts cultivated in the United States. Good specimens of the red gum can be seen growing in Phoenix. It is said that this tree can be planted in land that is periodically inundated for a considerable time, also in slightly alkaline situations.

Desert gum, Eucalyptus rudis, has been planted more, perhaps, in Southern Arizona than any other variety. With favorable conditions it is said to be one of the most rapid growing of eucalypts, especially when young. At Tuscon it has shown itself extremely resistant to summer heat and winter cold, never having suffered any injury therefrom. It is also drouth-resistant. For ornamental planting it is one of the best. Its commonly erect habit combined with its symmetrical form and dark green foliage, makes it a desirable tree for shade or avenue planting. There are two forms of the species, a weeping one and an erect oval-leaved one, the latter of which is the more desirable. Specimens of this tree growing under rather unfavorable circumstances on the University campus at five years of age average twenty to twenty-two feet in height and five and one-half to six and one-half inches in diameter. The desert gum, especially when newly set, is subject to a chorosis or yellowing of the leaves which eventually kills the tree. The disease is known locally as "frizzling" from the abnormal brush-like development of the young limbs. The affected plants should be replaced early by healthy ones.

Red box, Eucalyptus polyanthema, is another species equally resistant to heat, cold and arid conditions. It is of a more or less erect habit, usually with a single stem, though not

Paid Semi-Annually



7%

Assured Profit.

We offer you Cane Sugar Lands in Mexico. Perfect title. Give 50-year contract to cultivate for you, guaranteeing 7%, paid semi-annually, until crop profit exceeds this amount. Offer these lands for cash or on easy terms.

A Life Income from Land

Sugar Plantations produce the greatest continuous yield of any known crop. Tropical Mexico stands today unmatched in soil, climate, water. We own over 9000 acres in the heart of the best section—near Tampico. You become a land-owning profit-sharer in this project. We do all the work for you.

Sugar Plantations the Most Profitable Crop in All the World

One Acre Should Produce $203.52 Annually
Five Acres Should Produce $1017.60 Annually
Ten Acres Should Produce $2035.20 Annually

501 Union Trust Building

A Splendid Ranch Bargain

44 acres black loam mixed with lime rock gravel, in the head of the Nipomo Valley, rich warm friable soil that is hard to beat anywbere. Has 6-room hard-finished house, very convenient, large barn, good out buildings, about 5 acres orchard, apples, almonds, apricots, figs, pears, peaches, plums, prunes, quince, nectarines. Also grapes, currants, gooseberries, blackberries, loganberries, raspberries and dewberries. All these fruits do fine, and there would be big money in extensive planting of currants and gooseberries, as they do exceptionally well, and the market is first class. The place is 2 miles from Nipomo on splendid road, and is a grand bny at $4750.00.

We also have a fine buy in a completely equipped and well stocked 15-acre poultry ranch at $3500.00, including everything on the place, even the house furnisbings.

Curtis & Wiley San Luis Obispo, Cal.

Yaqui River Valley Lands

$12.50 PER ACRE

Alfalfa, wheat, corn, beans, sugar cane, oranges, lemons, limes, and other semi-tropical crops and fruits grown on these lands, rich alluvial and silt deposits.

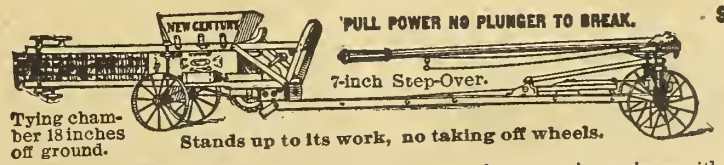
The Finest Irrigation System in the West

An abundance of water at 50 cents per acre foot. Terms offered during the next ninety days are extremely easy. For information write

WM. H. CANNON & CO., Ventura, Cal.

Rebuilt New Century Hay Press

WITH OUR IMPROVEMENTS IT IS THE STRONGEST PRESS ON EARTH. ALL IRON AND STEEL.



Tying chamber 18 inches off ground.

Stands up to its work, no taking off wheels.

We have rebuilt these presses and have taken advantage of two years' experience with all kinds of hay and can recommend and guarantee the press as it stands. These presses are 100 per cent better than the press as received from the factory and have our personal guarantee for the season. Sold on easy payments. A special bargain in a rebuilt second-hand press.

We carry the Pacific Implement Co.'s line of Buggies and Wagons and will be pleased to send Catalogue and prices.

CAPITO CARRIAGE CO., 12th and Main Sts., Los Angeles, Cal.

When writing advertisers, mention Cultivator.

always symmetrical in its development. Its silvery-gray round leaves render it a conspicuous plant in a landscape, contrasting nicely with trees having dark green foliage. On this acount it should be used considerably for ornamental purposes. A fine lot of young trees of the red box two years after planting may be seen on the west line of the University grounds, also on the Station farm at Phoenix. Those at the University average fifteen feet in height and three inches in diameter at the base. The red box is not so desirable for shade as the desert gum ,on account of its less dense leaf canopy. There are probably few localities in Southern Arizona having altitudes below 3000 feet where with sufficient, though scanty, water supply these two species may not be grown.

Narrow-leaved iron-bark, Eucalyptus crebra, also endures nicely the climatic conditions at Tucson. The trunk is ordinarily straight and of uniform diameter, and with the willow-like leaves and pendulous branches gives to the tree a graceful appearance. The narrow-leaved iron-bark is not known well enough yet, however, to be highly recommended. It is also subject to the chlorotic condition already noted for Eucalyptus rudis.

Manna gum, Eucalyptus viminalis, is growing successfully at Yuma and Phoenix. It is a very rapid grower, and in Australia becomes one of the largest of eucalypts. It was formerly much planted in California, but because its wood is of very secondary value, even for fuel, it has been largely superseded by the red gum. It is said to be of some value as an ornamental.

With reference to eucalypts for particular localities, the writer would suggest for altitudes up to 3000 feet, as on the upper Gila, desert gum, Eucalyptus rudis; forest red gum, Eucalyptus tereticornis; narrow-leaf Eucalyptus rostrata; for the Salt River and Colorado River valleys desert gum, Eucalyptus rudis; red gum, Eucalyptus rostrata; red box, Eucalyptus polyanthema; forest red gum, Eucadyptus tereicornis; narrow-leaf iron-bark, Eucalyptus crebra; and manna gum, Eucalyptus viminális.

The most favorable time to set out eucalypts is from the middle of February to the first of April, according to locality. They may be planted from four to ten feet apart, depending upon the water supply. The closer they are planted together the greater will be their tendency to produce straight timber.

California Mutual Live Stock Insurance Assn., 712-713 Delta Bldg., 426 South Spring St.
Los Angeles, Cal., Aug. 8, 1908.

Tuttle's Elixir Co.

Gentlemen:

I had occasion to use your elixir on one of my horses last winter, and I was very much pleased with the effect produced. The animal had fallen and bruised her leg severely, and considerable fever had set in. The elixir was applied a few times, and she recovered very quickly and completely.

I consider it the best remedy I ever used for bruises and cuts and for any other use where a liniment would be required.

Yours very truly,
M. L. Wright,
President & Gen'l Manager.

Let up keep up our end—especially the odds and ends.

Man's best traits are seen when he becomes a farmer.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Fertilizer for Potatoes.

Please advise me, under queries and replies, what would be the best fertilizer and the cheapest, to use before second crop of potatoes; would any green fertilizer do; if so, how would leaves do? I have only a small piece of ground, and want to get best results I can with least expenditure.—F. M. A., Ontario.

If you mean for this year's crop, only commercial fertilizer rich in potash would give best results; or possibly, well rotted stable manure. If you mean for next year's crop, sow green manure crop this fall; plow under in February or March. Leaves are all right for humus, but will yield little fertility, or probably none for this year's crop.

Tomatoes Dropping.

I saw a question concerning tomatoes shedding the bloom, and I have had a little experience. Had fine vines with here and there a tomato dropping bloom, just as described in the question. A friend said to trim off all the main stalks but three or four, and then prune off all the limbs—suckers, he called them, not leaves nor main head, but the limbs— with a sharp knife. I tried some of mine and now they are getting full of tomatoes that are growing very fast.—J. T. G., Orange.

Trank you. Let J. V. B. of Ripon try it.

Squirrel Pest.

I am very desirious of securing your influence for a concerted movement by the whole State against the ground squirrels. I find it is useless for a man to try to keep his own place clean if his neighbors do not poison or otherwise kill the squirrels on their holdings. I have been poisoning and bi-sulphiding my place for years, yet this year the squirrels have dug up two plantings of corn. There are more squirrels on my place than ever before. Without concerted effort there will never be much progress made toward extermination. My idea is to get a law passed that will appoint three days at intervals of four days as poisoning days and upon these three days the entire State must be poisoned, those neglecting to spread poison on the three days set apart as poisoning days to be heavily fined, giving the informer half of fine. The State or counties might furnish the poison. The government could furnish the poison at less cost than the payment of bounties. The object of all poisoning the same days is to prevent squirrels moving from poison. It might be well to have a second season of poisoning after an interval of six weeks. I think that a general discussion of the matter might lead to the extermination of this pest. The squirrels destroy more than all other pests.—J. S., Watsonville.

Squirrels are surely a perplexity. We question whether the above outlined law could be passed, but some more concerted action should be taken than ever has been done yet.

Tomatoes Dropping.

Will you kindly state in your paper the reason for tomatoes dropping blossoms with short piece of stem attached? There seems to be a joint in the stem which breaks off.—J. V. B., Ripon.

I have always had this trouble in California with tomatoes if the season was cool, as it has been this year. There is nothing I know of that can be done to remedy it. When the weather gets warmer the fruit will set perfectly. While the tomato plant will endure continued low temperature and appear in a thrifty condition, it will not set the fruit until there is warmer weather.—Q. A. L.

"During the Moon is Dark."

Kindlly tell me through the "Cultivator" why my Minnesota Burbank potatoes do not make potatoes at all, but only thrive as to their leaves and stems. Many roots of them are more than one foot long and they are sprouting on the surface of the ground. I planted them in the middle part of March and irrigated once on May 20th. I did not find any wrong for the seeds when I planted. Is that true that the potatoes are only planted during the moon is dark? Tell me why, if it is true, and oblige. —C. Toyoshima.

Without knowing more as to the character of the soil I could not answer this question satisfactorily. From the description it would seem as if they were planted in soil very rich in nitrogen and lacking potash. I trust our Japanese friend will take no stock in that deep rooted superstition among many people of the Eastern States, that every failure in the potato crop is due to the seed being planted in the "light of the moon." The moon has nothing to do with the conditions that secure a good crop of potatoes—or anything else. The natural laws that govern these things are found in proper soil and weather conditions.—Q. A. L.

Thrips or Red Spiders.

Will you please answer in your valuable paper the folowing question: How can I get rid of a very small, slender mite light in color, which is destroying my onion crop. They seem to eat off the very thin outer skin of the leaves which stops the growth of the plant and makes it look sick. Please answer next week.—I. M. P.

Also same question by C. A. Toms, Turlock.

Either thrips or red spider will cause damage to the onion crop similar to that named in these inquiries. As the red spider seldom gets in its destructive work except under a high temperature, and we have had an unusually cool season, I am inclined to pronounce it the work of thrips. It is a jumping insect and extremely active and varying in color from whitish yellow to dark brown and in size from hardly perceptible to the naked eye to the size of the largest aphis (green fly.) I know of no practical remedy for the open field. Sometimes they suddenly disappear from no apparent cause and the plants recover and mature a good crop. I had a marked instance of this a few years ago when manager of the Barbour ranch. About two acres were attacked when the crop was nearly half grown and I considered the case hopeless, but they disappeared suddenly and the plants soon recovered and assumed their normal growth and matured a fine crop. Under glass thrips will succumb to tobacco, especially by fumigation, but not nearly so readily as green fly.—Q. A. L.

Himalaya Blackberry.

Regarding the blackberry of which we recently had an illustration, Luther Burbank writes us as follows:

The berry described and pictured

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Cleveland, O.

on page 672 of your June 18 issue is not the evergreen, but is my Himalaya introduced fifteen years ago. New names make great confusion. —Luther Burbank, Santa Rosa, June 27, 1908.

Bee Paper.

Is there a bee paper published in this State?—A. S., Turlock.

Not one at this time, though many have been started.

How to Apply Manure.

I would like to ask Mr. J. W. Mills if one does not lose much of the value of manure if he cultivates, harrows or discs and does not turn it with a plow into the bottom of an eight-inch furrow. Scientific men tell us the sun burns up much of the value of manure if it is left on top of the soil or in the first three inches.—Wm. Crook, Covina.

We are not so sure that much of the value of manure is lost when left to dry on the surface. We are taught that such is the case and come to take it for granted that very much is lost in that way. The only element that can get away through the atmosphere is nitrogen, and that is usually considered only possible by fermentation in the case of stable manure. There are two methods advocated by recognized authorities for the proper and economic handling of this product. One is to keep it moist enough to prevent fermentation and the other is to dry it thoroughly to prevent fermentation. Manure that smells to heaven will lose much ammonia and will not stop losing it till after the odor ceases. It is our opinion that it is better to spread manure out as fast as it accumulates rather than allow it to remain in piles where it will surely lose a lot if not kept well wet down. If you have facilities to do this, we would advise you to pile it and keep it wet till scattered. Disking or cultivating it in will give results. Plowing it under is perhaps the best, but we would cultivate it in rather than not use it at all or miss the chance of getting it at a low figure. Perhaps you have noticed that droppings in a pasture make the grass grow best in those particular places even though the manure lies there all summer long on top of the ground.—J. W. M.

Apples, Fungus and Cow Peas.

I have three apple trees of the Early Harvest variety that for the last few years don't leaf out right and each year seem to be getting a little worse. At this time there are many of the twigs without a leaf on. I also notice on the exposed part of the roots around the body of the tree and also where limbs have been sawed off there is a substance resembling mold. Could you give me the cause and remedy through your valuable paper? Are cow peas a summer crop? How should they be put in for hay, amount of seed required, how often should they be watered for the best results; at what stage should they be cut? What yield could be expected; how is the feeding quality compared with other hay; ought they to do well in the Coachella valley?—Wm. H. O., Covina.

The action of your apple tree is due to climatic conditions over which you have no control. Your tree will have to grin and bear it till a favorable winter gives it a chance to get back into good habits. Your trees cannot distinguish between the seasons.

The mouldy growth that you notice on the stumps of your trees is a fungus that is feeding on the dead wood. It may penetrate to the live wood and kill the tree. This often happens. Wash it thoroughly with blue stone water and it will kill the growth at the surface or as deep as the wash will penetrate. The fungus penetrates clear into the heart of the tree and what you see is the fruiting parts.

Cow peas are a summer crop and do well in the Coachella valley. Plant them now, about forty pounds per acre and give them water enough to keep them growing. They make good feed and should yield from one to two tons of hay per acre. They rank with clover and alfalfa in feeding qualities.—J. W. M.

THE JARRAH TREE.

As was rightly stated by your correspondent in June 18th issue, the Jarrah, (Eucalyptus maginata) is not adapted to California conditions; while we can grow many semi-tropical trees, ours is nowhere a tropical climate. Cool nights and dry air in the summer are not in any sense "tropical" conditions. But this is what the Jarrah wants, so it is well to discard it. I was shown samples of the wood many years ago by the curator of the Museum of State Mining Bureau, at which time the adaptiveness of the tree was tested, and then found not to assimilate with other species, which find so congenial a home in California.

It is well that the question was raised, because, with the renewed interest in eucalyptus planting many false prophets will arise who will offer advise, and recommend varieties which experienced men like Mr. Dodson and others could at once say were useless, commercially.—Leonard Coates, Morganhill.

A SUNFLOWER.

Mrs. A. B. Hamel, of Moosa, sends a sunflower head to this office which was raised on land which had neither irrigation nor fetrilization, which shows that Moosa land grows big things.

NEW NAME—OLD FIRM.

The Los Angeles Vehicle & Implement Company whose advertisement appears in this issue is not a new firm, but a new name for an old and reliable house. This firm is a continuation of the retail business of L. M. Davenport, and, while the name has been changed, yet the business methods will be upon the same broad and liberal lines as heretofore. In their store will be found everything for the rancher and farmer. Mr. Davenport's long experience in the implement and vehicle business in California has placed him in a position to know the goods best adapted for soil and climatic conditions of this State, and whether your needs be large or small it will be to your advantage to write or call at their store, 110-112 North Los Angeles Street, Los Angeles, Cal.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

FARM LANDS FOR SALE.

..... $2.50

Cultivator Publishing Company

THE ENGINE QUESTION.

It is no longer a question of whether or not the farmer needs an engine—he has already been assured of the many advantages of having a good engine for almost any kind of work. But there seems to be a growing tendency on the part of some of the manufacturers to make engines to sell rather than to give good service. This naturally puts the farmer on his guard, but most of them are dealing with the old reliable concern—the International Harvester Company of America.

The principles were carefully worked out and tested before manufacture began. The record of service of the engines at work has abundantly established their correctness, as well as the excellence of materials and workmanship.

One of the greatest things that has been accomplished is dependability, a positive response of the engine whenever called upon.

Smooth, even running and generation of full rating of power are other features that are next in importance to dependable starting. Then comes the simpliicty and ease of control for which these engines are noted. And lastly, economy. The engines are adapted to the use of gas, gasoline or denatured alcohol for fuel. Well posted power men agree that whatever the fuel, the minimum is consumed for the power delivered.

The engines are made in several styles and range in size from 1 to 25-horse power. A letter direct to the International Harvester Company of America will secure catalogue and information you desire promptly.

MACHINERY.

FOR SALE—AT HALF ACTUAL VALUE No. 7 U. S. Cream Separator, good as new. One No. 9 machine new, to close out. K. B. Norswing, 5833 S. Main St., Los Angeles.

FOR SALE—6-H. P. INTERNATIONAL gasoline engine in good running order. Will sell cheap. N. W. cor MAIN and BRUNO STS., Los Angeles Cal.

FOR SALE—40-H. P. FAIRBANKS-MORSE distillate engine guaranteed the same as new at a snap. Also pump and other equipment. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles, Cal.

FRONTIER SKETCHES.

THE first Fourth of July celebration in Colorado was pulled off in 1859 at a place called Mountain City which was the original mining camp of the Pike's Peak region, but which was subquently absorbed by the growing together of Central City and Black Hawk in Gilpin county. The event of the day was the oration of Green Russell who knew more about panning dirt than propoundlng history and this is what he said:

"Feller Citizens: Had I the outgushing eloquence of a Apollo, the chain lightning tongue of a Mercury, the winnin' grace an' lnnocent unconsarn of a Venus standin' ln quiet rumination on her adamatic base, I in me, you have entrusted it to my care. Can I do it justice? (Cries of "Tackle it anyhow, Green.') Go back with me, to th first original origin of this day. The soil of this now extensively discovered country had never yet felt the passionate kiss of a white man's foot. At the base of Plymouth Rock a band of injuns was camped. They arose one mornin' as had been their custom for years, an' prepared for the usual duties of the day. A warrior who had gone to the water's edge to wash his dusky face an' no less dusky hands suddenly disturbed the peaceful echoes with the startlin' cry: 'Sail, ho!'

"'Whereaway?" shouted the chief, in great agitation' .Thereaway,' he

FOURTH OF JULY.

We greet today our nation's birth,
When stars came down to shine on earth;
They are shining high at noon today
O'er our broad land with undimmed ray.

First they shone 'mid the clouds of night,
When patriots won dear Freedom's fight;
Erst they were brave and only few,
Sweet as the breath of morn's pure dew.

When morn oped wide the gates of heaven,
And darkness was by Glory riven,
Came streams of white and crimson bars,
Companions for the golden stars.

Now as great suns they shine afar;
How splendld is each growing star!
Shining from azure depths sublime.
Down o'er the ocean depths of time.

Long as the years shall live and die
New stars will come down from the sky;
Then climb aloft in flag of blue,
Which waves so proudly over you.

No! ne'er shall our bright stars grow dim,
That steadfast put their trust ln Him
Who sends them from His radiant throne,
As watch and warders o'er His own.

—Edwin Sleggins.

oould not sufficiently accord my thanks to the wisely discriminating committee of honored citizens who selected me as the oratorlcal luminary of this conspicuous occasion. (Applause.) Hence I will repress my gratitude and proceed to my theme. The subjeck around which I shall try to twine the laurel wreaths of eloquence on this conspicuous occasion is one which would rouse the fires of paterotlsm in the quiverless breast of a marble statute and cause its unsullya cold and silent lips to move in a burst of paterotic fervor. (Applause.)

"The day We Celebrate, Gentlemen my tongue falters w'en I contemplate the bottomless immensity of the theme and realize that, with the undylng confidencc you have ever reposed responded, polnting out over the breast of the discontented waves. Far out at sea a sail was discovered. Nearer and nearer it drew, risin' an' fallin' on the impatient waves, an' as it neared the shore the natives beheld with awe a lordly man in kingly dress lookin' through a telescope. I tell you, gentlemen, that man was Columbus, and he was at that moment engaged in discovering America. The natives drew back in timid alarm as the vessel approached an ground her prow into the sandy shore and a moment later Columbus stepped ashore an' claimed thls ge-lorious land an' planted in the sacred soil the great flag of freedom an' liberty, a counterpart of which is now afloatin' over us, thanks to the paterotic spirit of the boys who have contributed their overhalls and shirts (Wild applause.) That, feller citizens was the Fourth day of July an' ever since that day has been one of rejoicin over that fortunate discovery. Oh feller citizens—"

"Beggin' the speaker's pardon," said old man Gregory, who had gone down in the audience where he could better hear the judge, "but aren't you a little mixed in yer dates? We do not celybrate the diskivery of America today, but the birth of the immortal Washington. We are here—" "I will not permit myself to be interrupted. I know w'at I'm takin' about, an' if you are gropin' in blind ignorance, you should endeavor to suppress the fact an' set still an' try to learn somethin'." "I tell you, sir," replied Gregory, "we celebrate the birth o' George Washington an' not the landin' o' Columbus an' the Pilgrim fathers. I know fur my father fit under Washington." Just then Green Russell peeled off his coat and everybody fit so that the celebration broke up in a rough house. —Field and Farm.

GETTING ACQUAINTED WITH DAD.

I use' to think my papa was an awful solemn man,
An' when he was at home I never sung or yelled or ran
Buhcause I didn't dast to! An' buhcause when he'd come in
He's tired from talkin' business to the folks where he is been.
I use' to call him "father;" I don't half to any more
Buncause we've got acquainted like we never was buhfore,
An' him an' me, we understand each other an' are glad,
An' he don't care a little bit if I should call him "Dad!"

He stayed at home one day las' week, an' took me for a walk,
An' for a little while, why, I was 'most afraid to talk,
But pretty soon he ast me if I knowed what kind o' bird
Was singin' 'way up yonder, when its song was all we heard—
An' I told him it was a lark, an' then he told me why
It likes to sing, an' sing, an' sing away up in th' sky.
I was surprised, buhcause I never thought my papa knew
Th' leastest thing about th' birds, like other people do.

An' nen, why, purty soon he found a willow tree, an' made
A whistle for me, an' showed me how it could be played
By just a cuttin' little holes, till it was like a fife—
I never been surprised so much before in all my life.
An' he told me lots of thing' an' showed me how to see
Which way is north, by lookin' for th' moss upon a tree,
An' how a daddy long legs finds your cows 'at's ruuning loose,
An' how grasshoppers will set up an' spit tobacco juice!

An' lots o' other things! Why, say, you never could have guessed
My papa'd ever been a boy like me an' all th' rest.
He re-lly was, though, for I ast him if he'd been a boy
An' he said somepin 'bout th' days o' sunshine and o' joy,
An' he said he was a boy one time an' now was one again,
'At boys could still be boys, although they growed up to be men.
So him and me, we understand each other, an' I'm glad,
An' he don't care a little bit, if I should call him "Dad!"

—Chicago Evening Post.

ECONOMY.

Small Gilbert—Papa, didn't I hear you tell mamma we would have to economize? Papa—Yes, my son. Small Gilbert—Well, you might begin by getting me a pony; then I shouldn't wear out so many shoes.—Chicago News.

THE BUNGALOW.

There's one word I hear
  Wherever I go;
'Tis a queer importation,
  The word bungalow.

All over the land,
  The North and the South
The bungalow theme is
  In every one's mouth.

The master and mistress,
  The groom and the maid
Are studying plans
  To see how they're made.

One kind's built of plaster,
  Another of logs,
But all are constructed
  With queer little jogs.

There is one room in front—
  Half a dozen combined;
The others are fastened
  Somewhere on behind.

But then, after all,
  The most room is outside,
Where porches are broad
  And mosquitoes abide.

It's the funniest thing—
  Whatever I do,
I've just got to have
  A bungalow, too!

—E. Irving Farrington in Woman's Home Companion.

FLIES CAUSE EPIDEMICS.

The history of recurrent epidemics of contagious diseases, both in Chicago and throughout the country, is the history of unusual prevalence of the insect pest, the greatest of which is the summer fly pest.

The typhoid epidemic which ravaged Chicago in 1902, and which caused a death roll of 402 persons within three months, was directly traceable to insanitary conditions and the transmission of disease through the fly pest.

Chicago health officials of the health departments and physcians and surgeons after exhaustive experiments have declared that flies are the greatest common carriers of contagious diseases and the most deadly agents of infection. They have declared from time to time that at all cost flies and insects must be kept from foodstuffs, milk, and from living rooms in homes where there are cildren. Infectious children's diseases and the child mortality rate are caused almost wholly by the prevalence of flies in the home, it is said, and either direct infection or indirect infection through contaminated foods with which they have been allowed to come in contact.

The results of experiments by government surgeons and army physicians and other medical experts afford ample backing to the statement that of all summer dangers the fly pest is the greatest, and against which the least precautions are taken .

Convey Many Diseases.

The most common mode of infection by insects in our part of the world is undoubtedly by the indirect method, the infection of foodstuffs by insects which have come in contact with infected material. Cholera, typhoid fever, tuberculosis and perhaps dysentery are the diseases which are probably most often conveyed in this way. Most important for us is the connection between flies and typhoid fever and probably dysentery. The common house fly is the insect chiefly to be dreaded, for it has a far wider range of activity than has any crawling insect, and its presence is not regarded as a disgrace to a well-conducted household or institution, as is the presence of other insects. The conclusions are almost too obvious to need statement. Rapid disposal of all infectious material and scrupulous care in the extermination of all insects, especially the common housefly, should be among the most ordinary rules of household and institutional hygiene.—Chicago Tribune.

HOMELY HINTS.

A little of the outer part of orange or lemon peel, grated over a cake before the icing is put on, will flavor the cake all through.

If pies are allowed to remain in the pans, in which they were baked until cold, the under crust will be much more crisp than if put on plates when taken from the oven.

Never put a pan or paper over a cake while baking, as it is almost sure to cause the cake to "fall." If the oven is too hot, place a vessel of cold water therein. This will cause the temperature in the oven to fall several degrees.

Butter should never be melted before being added to cake mixture, as it will spoil the cake every time. In cold weather it may be softened a little, however. Always rub the butter and sugar together until a cream is formed, using for the purpose a cake mixer or wooden paddle.

Sponge cake and all others made with cream instead of butter require the addition of salt, no matter whether it is mentioned in the recipe or not. Remember to add salt to all cake mixtures in which butter is not an ingredient. A half teaspoonful of salt to a quart of batter is about right. The salt contained in butter is usually sufficient.

In cake baking, always use the best brand of baking powder. Cheap baking powders are worthless. If a good brand cannot be procured, a very satisfactory powder may be made by simply mixing soda and cream of tartar together in the proportion of one part of soda to two of cream of tartar. Take one-fourth pound of baking soda and one-half of pure cream of tartar, sift together several times and place in air-tight cans for use.

To make delicious, crisp cookies, take a quantity of pie crust made in the usual manner, add to it some brown sugar moistened with a little cold coffee, a generous sprinkling of ground cinnamon, a little soda or baking powder and enough flour to enable you to knead well, though the dough should not be too stiff. Roll out in a sheet about one-fourth of an inch thick, cut with a cooky cutter and bake in a rather hot oven. In making pie crust, if boiling water is used instead of cold for moistening the ingredients, the crust will be more crisp and a little less shortening required.

Someone who has tried it says that charcoal will heal an ingrowing toe nail when less simple remedies have no effect. Burn the head of a match and powder the charred part, pressing it down around the nail.

The white of an egg beaten up with a little sugar and the juice of an orange is a pleasant drink for an invalid.

Medicine which would injure the teeth may be taken through a bit of macaroni with perfect safety.

A mop wrung as dry as possible out of warm water with a spoonful of ammonia in it, will clean the sick room floor better than anything else. Sweeping should not be tolerated.

A fever patient can be made cool and comfortable by frequent sponging off with soda water.

Consumptive night sweats may be arrested by sponging the body nightly in salt water.

One in a faint should be laid flat on his back, his clothing loosened and then be let alone till consciousness returns.

For a corn or bunion paint over every day with the following solution: Collodion, one-half ounce; sodium borate, one-half dram; extract cannabis, one-half scruple.

An air cushion or hot water bag, partly filled with air placed under pillows in the go-cart, will prevent the jarring of the baby's spine of which the doctors complain in the use of go-carts.

Always iron embroidery on the wrong side so as to bring out the pattern.

A tablespoonful of kerosene in starch will keep it from sticking.

If you scorch an article badly when ironing, moisten it with lemon juice, rub in some salt and lay it in the sunshine. If it is only a slight scorch the sunshine alone will remove it.

If possible, sprinkle the clothes the night before ironing day. The dampness will be evenly distributed and they will iron easily next day.

Black goods will not look shiny and the white starch will not show on it if it is ironed on the wrong side.

To make an article very stiff add a teaspoonful of powdered borax to the cold starch.

To bleach handkerchiefs after washing, let them soak over night in water in which a bit of cream of tartar has been dissolved.

A cup of water drunk before meals will relieve nausea and dyspepsia.

HOW MUCH TO USE.

Below we give an answer to every "how much" question that can arise on baking day. Housekeepers should preserve the list:

One cup of sugar will sweeten one quart of any mixture to be served chilled or frozen.

One teaspoonful of extract will flavor one quart of custard or pudding.

One tablespoonful of extract will flavor one quart of mixture to be frozen.

One level teaspoon of salt wil season one quart of soup, sauce or vegetables.

The ordinary French dressing, made with three teaspoons oil, one and one-half tablespoons of vinegar, one-fourth level teaspoon salt, one-eighth level teaspoon pepper, will moisten one pint of salad.

One teaspoon of water or milk should be allowed for each egg in an omelet.

Allow four eggs to each quart of milk in making cup custards.

Allow from four to six eggs to each quart of milk in making a custard to be turned from the mold.

Rice will absorb three times its measure of water and a larger quantity of milk or stock.

One ounce of butter and one-half ounce of flour are used to thicken one cup of liquid in making a sauce.

Allow two level teaspoons of baking powder to each cup of flour when no eggs are used.

HOME, SWEET HOME.

The wife of a naval officer attached to the Academy at Annapolis has in her employ an Irish servant, who recently gave evidence of nostalgia.

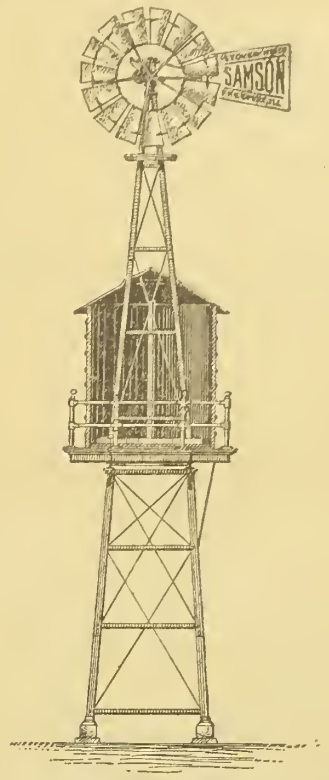
"You ought to be contented and not pine for your old home, Bridget," said the lady of the house. "You are earning good wages, your work is light, every one is kind to you, and you have lots of friends here."

"Yis, mum," sadly replied Bridget; "but it's not the place where I be that makes me so homesick; it is the place where I don't be."

Gridley is shipping large quantities of berries.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Dried Fruits.

It now appears that apricots will rule low. One dealer said on the market Tuesday that he believed good dried 'cots would not command over 5 or 6 cents. The output is predicted to be over a thousand cars.

Notwithstanding the reported shortage of prunes, the market remains flat. "Nothing doing" is the report with all dried fruit dealers.

BUSINESS DAIRYING.

"It has been proven by repeated experiments, and by the most up-to-date dairymen all over the country, that dairying improves a farm more than any line of farming.

It costs less to produce a ton of butter than it does to produce a ton of wheat. A ton of wheat takes $7.00 worth of fertility from the soil. A ton of butter takes 50 cents worth of fertility from the soil. Wheat is worth $20.00 per ton, and butter over $400.00 per ton."

The above is the opening of a neat little illustrated booklet issued by the Sharples Separator Co. of West Chester, Pa. Dairymen will find it well worth ... for

San Francisco Markets

SAN FRANCISCO, June 30, 1908.

Butter.

Butter strengthened the last of last week, but has again sagged to a half cent under last week. It is now firm in tone.

Hay.

Shipments of hay for the week just ending show a considerable increase over the report of last week, 3860 to in comparison with 3150. Because of these heavy arrivals and the continued dullness in trade, the market has weakened materially. Yesterday with arrivals of about 1800 tons the market was badly demoralized and all receivers work strenuously to dispose of their consignments. Many sales were made at low prices and it was generally conceded that with this break but little hope could be had of healthy state of affairs here for a long time to come. Hay is offering from every side with buyers exceedingly reluctant to pay the asking price. Although the crop is none too large yet the demand here is excedingely limited and it is now generally conceded that prices will have to range on a more moderate basis throughout the remainder of the harvest season.

Aside from local trade being very quiet we find that shipments from San Francisco are exceedingly light. The market has enjoyed the bulk of the trade with the Hawaiian Islands, but now because of lower prices in Seattle, large quantities of grain hay are being shipped to Honlulu from that Port. For many years timothy alone was handled in the northern market but now grain hay is becoming quite a factor there.

A farmer at Santa Ana has been awarded $2000 damages because of having purchased seed which he asserts was to be beardless barley, which proved on harvesting to be nothing more or less than the common bearded barley.

Tulare county Valencias are all gathered.

A FEW POINTS ON PUMPING PLANTS.

One of the essential points on a pumping plant is to have the best possible power to drive your pump. It is now an established fact that the gas engine is the most economical and satisfactory power within the means of the farmer today.

The next point is to choose your gas engine. In doing this one should look to simplicity and durability rather than cheapness. Put an expert on almost any gas engine and he can make it run. The average farmer has not the time to become an expert gas engineer; he is too busy being an expert farmer; therefore wants a gas engine that can easily be understood and which will practically run itself. To fill these conditions a gas engine must first have few working parts and, second, these parts must be easy to get at and their reasons for existence must be apparent to any man of ordinary intelligence. Then last, but not least, a gas engine must be easy to start.

From time to time mention has been made in these columns of the Stover gas engine, which is handled by Livingston & Lee. This firm has been handling the "Stover" on this coast for a number of years and have gradually pushed it to the front until now it is acknowledged as a factor in the gas engine community; in other words, it is a standard engine. They consider themselves in a position to demonstrate that the "Stover" has all the above mentioned qualities as durability, reliability and simplicity. They have a sample engine actually pumping water under a lift and are ready to prove to you that the engine is running on California distillate. If you are interested in gas engines, we feel sure that a call on Livingston & Lee, 354 South Los Angeles Street, will be to your advantage.

Yolo county is endeavoring to bring about an extensive construction of Macadam roads.

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

CAPITAL FULLY PAID $1,000,000.00

Alexander Craw

A Tribute by JOHN ISAAC of Sacramento.

WHILE other men have been more widely known, no other was more genuinely respected, and his loss will come as a severe blow to hundreds with whom he was brought into contact in our State and in Honolulu, where duty called him during the latter years of his life. He was a man of most loveable disposition, deeply conscientious and scrupuously honest. For many years he served with the State Board of Horticulture as Chief Quarantine officer, and later as Deputy State Horticultural Commissioner, and during this time he held a prominent position, not only before his own State, but before the whole world, and in all matters connected with his favorite science, Mr. Craw's word was accepted without question. He stood first among all men in our State as authority on all matters concerning horticulture and entomology, and his opinion was sought and accepted by the highest authorities on earth. His reputation for truth and thoroughness was not confined to his own small circle, but extended to all sections and when the Hawaiian Islands needed a reliable man to protect their horticultural interests Mr. Craw was naturally the man selected. Yet, with his innate modesty, it was long before he would accept the tempting offer held out to him to transfer his labor from his loved State to the islands, but after much importuning on the part of the growers of the islands he consented and entered on his new field of labor in which he continued until the hand of death marked him for a victim.

Alexander Craw was born in Ayrshire, Scotland, fifty-seven years ago. In his boyhood he was apprenticed to a gardener and florist. With characteristic energy, he took up his work determined to master its every detail. It was in this practical school that his attention was first turned to that field in which he was ultimately to hold so brilliant a place—entomology. His employers son recognized that in the young man they had a character of more than ordinary worth, and rapidly advanced him, until he became manager of a large branch of their business and, as such, traveled extensively over Europe and the British Islands. His excessive labors added to the strenuous efforts he brought to play, undermined his health and he was advised by his physicians to make a change. In accordance with this, he set sail for California crossing the Isthmus, and arriving in San Francisco in 1873. He went to San Diego, where he was engaged by Mr. Asher for some time, after which he accepted an offer from the Wolffskill orchard, which stood on the present site of the Arcade Depot, at Los Angeles, to take charge of that historical and valuable property, and it was there that he was when he recived the appointment, in spite of his own protests, as State Horticultural Officer.

From the time of acceptance of the management of the Wolffskill orchard until after his removal to the Hawaiian Islands he retained his residence in Los Angeles which, to the time of his death he regarded as his home, and his last wish was that his remains should be brought here for interment, which was done. He leaves a devoted wife and four sons, to mourn his loss beside the host of acquaintances he had made in the course of his long residence among us, for no one knew Alexander Craw but to love him, and his loss is not confined to his immediate family but extends to the State.

There was something almost feminine in the swetness of his character, and he would at any time much rather suffer a wrong than inflict one.

Varieties of Grapes for California

J. W. MILLS Writes of Varieties Which He Has Observed Have Done Well in This State

THERE ARE many hundreds of varieties of grapes growing on this coast and in California, all of recognized good quality in their places. There are a number of comparatively recent introduction, from five to twenty years back, that are of special interest.

The two earliest grapes known are Luglienga and Persian No. 21. We do not know which is the first to ripen in the desert regions, they being about even near the coast. The name Luglienga is descriptive, meaning "July Grape." It is a favorite in Italy and in Piedmont is called "Bona in Ca," meaning good to grow on the house. In Germany it is called "Seidentraub," meaning silk grape, so called from the soft silky feeling it imparts to the mouth when being eaten. It is amber in color, turning yellow when overripe. It was a most delicious grape when grown at the old Pomona Experiment Station and ripened about a month earlier than Thompson's Seedless. This grape has remained unpopular in most parts of California because it is a very shy bearer. At the Pomona Station it is considered a failure on acount of this, producing barely enough fruit to furnish samples. The station sent cuttings of this grape to Indio some three or four years ago where they are now in full bearing. These vines last year produced a crate to the vine and sold for better than $4.50 per crate. At Indio they were pruned short. This grape has not been tested under refrigeration and it is still an open question if they will come out of it in good shape. Some varieties of white grapes come out discolored. We were told by one of the best authorities on marketing of grapes that Luglienga had the appearance of being one of those that would not stand refrigeration. For local market it has not been excelled. It has gone through the mail from Brawley to New York and arrived as half cured raisins.

Persian No. 21 is about as early as Luglienga and may be earlier. This point is not positively determined yet by the station. A red Persian grape called Paykanee Razukee is very early and a strong grower. It is not far behind the two mentioned above but is liable to be a poor color in the desert regions even though it proves to be a good bearer. It is not prolific in the Pomona valley, and is subject to coulure.

Trenthem Black is a grape grown by Mr. E. D. Sturtevant of Hollywood and is of exceedingly fine flavor and one of the early sorts. Purple Damascus is a variety that is a practical failure in the Pomona valley some seasons and at other times produces a fair crop. It is too well known to need a description. It is one of the purple grapes that mature well in the desert country and develops a fairly good color. It has proven itself a good shipper, having brought the highest returns of any variety shipped out of the Imperial valley last year. It is a long pruner and should be grown on a trellis. When pruned short in the Imperial valley, it is slightly affected with coulure on the inside of the vines, but where it is exposed to the open it sets a good bunch.

The above grapes all ripen early and down to the Thompson Seedless period which is about the first of September from Riverside toward the sea. In the Imperial valley and Coachella valley they are ripe in May and June.

Thompson Seedless is one of the most prolific when grown under ideal conditions. It is wonderfully prolific on the medium heavy soils of the Sacramento and San Joaquin valleys and on the desert lands of the south where there is some clay mixed with the sandy soils. There is a pink variety of Thompson Seedless introduced into this State by the Agricultural Department of the State University, some years ago. It was thought at the time that it would quickly supplant the regular variety as a shiping grape, but the latter sems to hold its own.

Muscatello fino is a black grape with a very strong musky flavor and very sweet. It is one of the most popular grapes for the home vineyard. It will not produce well if pruned short but is very prolific when pruned long. It may be pruned half long with good results.

Pizzutello de Roma is a popular grape where known, for arbors and is of good flavor. It has long cresent shaped berries on a long loose bunch, making a very attractive appearance. The fruit is greenish yellow, tender and crisp. It is not prolific but a regular bearer in our light and dry soils.

Chavooshee is a Persian grape of great promise

With the Citrus Growers

GUM DISEASE.

THE Cultivator has had much recently on Gum Disease, but the perplexing nature of the disease causes many questions to appear as to cause and remedy. So we give the following which was written by Judge A. F. Call of Corona. It is being circulated by the California Fruit Growers' Exchange:

"I am in receipt of a letter from Mr. Kendall, concerning the gum disease, and, as I have made a close study of this question, both in Florida and California, I thought perhaps you might wish to give our growers the benefit of my observations. I found on coming to California, early last year, that I had twelve hundred lemon trees out of three thousand, more or less affected with gum, and four hundred orange trees out of sixteen thousand affected with so-called scab. After treatment for one year, all the gummed lemon trees, with the exception of four, have either fully recovered, or are well on their way to recovery. and now of a deep green color, well set with fruit, and all of the scabbed orange trees are showing marked improvement and on the way to recovery. I have made it a point to investigate these troubles in nearly every colony in California and several districts in Florida and believe that I know the cause and a cure for this trouble and am satisfied that if drainage conditions will permit, these troubles can be prevented and trees that are not entirely gone can be cured.

"I came to the conclusion that this trouble was not a disease but was simply a mechanical proposition, and to demonstrate this, I inoculated several healthy trees by inserting chunks of gum under the bark, with the result that no tree was affected. On the other hand any injury to the bark will cause the gum to exude. This may be caused in a variety of ways. In some instances I found a small root encircling the trunk of the tree just above the crown roots, which had become imbedded in the bark and caused a stoppage of the flow of sap. I other cases, I found that hard ground had buried some pebbles in the bark, with the same result. In other cases I found that hot manure around the trunk of the tree deteriorated the bark. In other cases, standing water around the trunk of the tree had injured the life of the bark, but by far the most common cause, and in fact perhaps ninety per cent. of all the cases, is caused by earth around the trunk of the trees above the crown roots. As I look at it, the reason of this accumulation of earth affecting the bark is, that the bark, which nature intended to be above the ground, is more tender than the bark on the root, which nature intended to be below ground, and becomes easily affected, when deprived of air and in contact with the earth, especially wet earth.

Same on Both.

"The gum disease of the lemon trees and the scab disease of the orange trees is substantially the same trouble, and comes from the same cause and that is an injury to or deterioration of the bark of the tree which impedes the downward flow of sap. I believe an examination will show a darkened or deteriorated condition of the bark somewhere on the trunk of the tree below the point where the gum is exuding.

"The treatment should commence with the removal of the cause and that is by removing the earth down to the crown roots and giving the tree proper drainage. This should be done very carefully, as there is danger that the hoe or shovel of the workman will bruise or cut the trunk or crown roots and thus cause additional trouble. When the earth has been removed, that portion of the trunk, which has been covered with earth, should be whitewashed, to prevent injury caused by sudden exposure to the air and sun. The next thing to do is to split the bark to permit the escape of the surplus sap, to prevent its accumulation and consequent destruction of the bark. This should be done by making a narrow furrow from one-sixteenth to one-eighth of an inch in width from the limbs to the ground. About four of these furows are usually sufficient at about equal distances apart.

"It is a great mistake to make several short gashes around the bud, as is frequently done, for this brings the surplus sap all to one point and causes a greater injury. It is also a mistake to remove the bark, as is frequently done, which is supposed to be affected, for this causes a big wound, which it takes a long time to cure, and my experience has shown that the largest part of the bark, which appears to be affected, will recover when the cause is removed and the surplus sap permitted to escape. After this is done, all the affected portions and furrows through the bark should be thoroughly covered with neatsfoot oil. There is a double advantage in the application of this oil. One is that it has a softening effect on the bark and aids in restoring its sap carrying power. The other is that it prevents the gum from sticking to and hardening on the bark and facilitates the removal of the gum, which will flow from the furrows.

Watchfulness.

"After the trees have been treated they should be carefully watched and two or three weeks after the first treatment, they should be gone over again, and gum removed from the furrows, with a second application of the oil, and this watchfulness and care should be continued until the gum has commenced to form.

"It will be found that at the end of the year, all the trees not badly affected will have recovered and those which have been affected over considerable area will show some affection just above the old scars, owing to the injury of the bark still existing, with not enough new growth to carry all the sap. Most of the trees carrying a large amount of sap may have been so badly affected, that there is not sufficient amount of bark left to cary so much. When this condition is found, or, in fact, wherever the tree is more than half girdled or more than half of the bark is seriously affected or dead, the top should be cut back in proportion to the injured bark. That is, if one-half of the bark has been destroyed, one-half of the top should be removed. If only a strip two inches wide of good bark remains, but a very small top should be left.

"Last year I had one tree with a trunk about six inches in diameter, that only had left a strip of bark one inch in width. I cut the top of this tree severely. Now that strip is three

SAMSON WIND MILLS
Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.

inches in width, the top has grown vigorously, the tree is full of fruit.

Stitch in Time.

"I believe that any one having a grove showing gum should not wait for it to develop, but should prevent it by carefully removing all the earth to the crown roots, and most growers will be astonished to find how deep their trees are in the ground. This is partly caused by original deep setting, partially by plowing the earth to the trunk of the tree and leaving it there, and partially by sediment carried from the upper end of the grove to the lower and there stopped by a dike or head ditch.

"After the earth has been removed, it is important to prevent a basin for water being formed and therefore the excavation should not extend more than a foot from the trunk of the tree. The trees that are very deep should be boxed with a box about two feet square, extending above the ground. The trees that are not so deep should be filled with loose sand or gravel, as this will permit some aeration and will not cause the disease that a hard or wet earth will cause.

"In making the furrows in the trees, I had a little tool made which is much better than a knife, by taking a thin bladed blacksmith's knife and having the blacksmith bend it in the middle to a sharp angle and then sharpen it. It will cut a furrow about one-sixteenth of an inch wide and avoid the danger of gashing or haggling the tree, which might be done by a careless workman with a knife."

THE AVOCADO OR ALLIGATOR PEAR.

This remarkable fruit comes to us primarily from Mexico or Central America. Indeed, it is quite within the limits of legitimate speculation to assume that its original home may have been the lost continent of Atlantis; that it has come to us by way of Yucatan or Guatemala, and that in Atlantis it was brought to such a high state of perfection that after thousands of years of comparative neglect it still retains qualities of wonderful interest.

In the opinion of very many people the Avocado is the best of all fruits. I know of none whose votaries are more enthusiastic. It makes the best of all salads, as it stands midway in its composition between fruits and nuts, embracing many of the attractive qualities of both. There seems to be a fascination in its flavor which lingers on the palate, and to those who know its taste, the price, like that of champagne, is a secondary consideration. Hence we find fruits imported from Mexico, Hawaii and other countries selling at $3 and more per dozen wholesale and the demand constantly growing.

It is hardly probable that here in California we can ever produce fruit quite equal in size to the largest from the tropics, but there are smaller and hardier varietiees which are no whit inferior but rather better in flavor and richness which have been found to do well. These are from local or Mexican seeds whose ancestors for many generations have grown in a climate much like our own. In Southern California there are perhaps a hundred trees old enough to bear. Of these about ten produce abundant and regular crops. Fortunately they are so located as to indicate that there is a considerable area adapted to Avocado. Of these first class trees one or two grow at Hollywood, two or three in Los Angeles, one at Monrovia, one at Santa Ana, and I have two or three. One of those at Hollywood is probably the most prolific, but the size of the crop and the amount received for it I hardly dare to put in print, lest I appear foolish to the uninitiated.

It is from these trees that we must establish our groves. Probably the safest plan is to plant in orchard seedling trees, direct from the can or pot in which they are started, and bud over those which prove unsatisfactory, for many have found the Avocado, like its near relative the Camphor, rather cranky about transplanting when balled, though it buds readily enough.

As there is an uncommonly great variation in the time of blooming and also in the period required for the fruit of different types of trees to come to maturity, an orchard may be obtained by selection which will bear continuously. This is, of course, very desirable to the consumer and material to the market grower, as there is plenty of demand at all times.

To conclude with just a word of prophecy or query rather: The next "craze" will be about the Avocado?"—C. P. Taft, at Whittier Institute.

THE DESTRUCTIVE PEST IN ITALY.

The cultivation of olive oil which constitutes an important industry of Italy, is suffering severely from the ravages of a virulent pest—the keiroun or oil worm. In the northern parts of the country the oil yield has been in great demand owing to its low acidity and almost complete lack of smell. Up-to-date methods of gathering and grinding the olives together with improved preserving processes are being adopted with the result that increased demands for the product from various parts of the world have arisen, but the poorness of the crops has considerably depreciated the supply with the result that prices have increased. Outside of Italy the greatest bulk is purchased by Great Britain, but for the past few years exporters have been draining their reserves and as these are now very low the oil promises to become a luxury unless some expeditious means of combating the havoc wrought by the oil worm can be discovered.

The government has granted a subvention for investigating the disease and the discovery of an efficient remedy. The oil worm when in the fly stage infests the young fruit and inflicts widespread injury. Fairly satisfactory results have been secured by the utilization of a dachicida or larva-killer invented by Mr. de Cillis. This is a solution composed of molasses 65 parts, honey 31 parts, glycerine and arseniate of soda each two parts. This is mixed with water in the proportion of one part to nine parts of water and sprayed on the trees by means of a hand pump, the application being made from four to six times during the season. That it is efficacious to a certain degree is borne out by experiment, for areas so treated have shown only from ten to twenty per cent of olives attacked, while in adjoining districts not so sprayed the damage has aggregated as much as 80 per cent of the crop. The remedy, however, is not of an exterminating nature, especially in those places where the trees grow to a height of 60 feet. In order to bring about the complete extermination of the pest it is urged that the government should pass a measure ordaining the collection of the crop by the end of March at latest. By such means the fly would be starved out of existence. Observation has shown that the pest always attains alarming proportions after a plentiful crop when harvesting is perforcedly delayed, the fruit remaining on some of the trees as late as May or June, when in other districts the fruit is just commencing to form. As a result the fly forsakes the older trees for the young, tender fruit, while the mild weather which prevails at that period favors its rapid multiplication. By legislating the harvesting of a crop not later than March, when other trees are only just sending forth the blossoms, the fly, unable to obtain any subsistence during the interregnum, would be starved to death.—Scientific American.

Deciduous Fruit Culture

TABLE GRAPES ON RESISTANTS.

A Cutivator representative recently amongst the vineyards near Martinez found some little concern regarding condition of the grape vines, which have been grafted on resistant stock. They have grafted large growing heavy vines on the slower growing roots, which has caused the trouble which some ascribe to some unnamed disease. Charles Baumgardt one of the oldest and largest growers there, however, informed the Cultivator representative that it is neither a disease nor an insect, but gives his belief in the following interview.

* * *

The resistant vine is too light for such large growing vines as Tokays and Cornichons. They form too heavy a trunk for so slight a root. They require a large amount of sap and draw too heavily upon the root which causes its ultimate death.

The people who are not acquainted with the resistant stock think it is taken with some disease and do not realize that the root is unable to bear the burden placed upon it. Heavy fertilization will help to prolong the life of the root.

The resistant stock is good for wine grapes, especially for the Zinfandels, as they do not grow such stocky vines.

Wine grapes grow best on the hillside or high land, and when grown under these conditions have a larger content of sugar, than if grown on the lower and richer soil.

The table grapes, however, have grown larger and better grapes, of better keeping quality, on the lower land. Table grapes, in my opinion, are always best grown on their own stock.

On the question of plowing, Mr. Baumgardt is decidedly opposed to deep plowing. It cuts the feeders from the vines and causes damage, which is sometimes ascribed to phylloxera. Shallow plowing for vineyards is best, and should not be too close to the vines. Plow less and cultivate more.

Vines often die from neglect, as many farmers allow their hogs to die from not giving them proper conditions. Let the farmer who has sickly-looking vineyards reform his cultivation and general care of the vineyard and give to it his best and most intelligent attention.

Mr. Baumgardt has cared for his vineyard for about 22 years and has taken much money for it, and it is today one of the best of commercial vineyards.

PRUNE DROP.

Regarding the prune drop, which has been so extensive this year as to be almost a disaster, the San Jose Times says:

The point has been reached now when it can be definitely stated that the prune crop will be very light. Young fruit fell from the trees in large quantities and thus what promised at the budding period to be a bountiful harvest has dwindled away. Fruit growers themselves are unable to determine just what has caused the young prunes to drop from the trees. All kinds of theories are advanced, but the most plausible seems to be that the sudden climatic changes are responsible for the prune crop shortage. Thrips can not be charged with all the damage, or even with a tenth of it. While thrips did some damage, the extent of their ravages this season is very limited. Fungi have not been numerous this season, and they can not be blamed for the almost unprecedented dropping of prunes from the trees.

A condition which is taxing the brains and energies of the scientific men of California confronts the prune growers of this and other sections of the State. All over California, where the prune is grown in commercial quantities conditions similar to those in Santa Clara valley are found. The young fruit will drop from the trees, and as yet no successful preventive has been discovered. Experiments are being carried on in an effort to overcome this serious drawback to one of the greatest branches of the fruit industry of this State.

POWELL TO WORK IN THE NORTH.

G. Harold Powell, to whom the citrus fruit industry of Southern California owes so much for his investigation into the cause and prevention of decay in oranges in shipment, will carry on a series of investigations along similar lines in relation to deciduous fruits, and for this purpose has established quarters in Sacramento, where in connection with Prof. Steubemrauch, he will work during the shipping season this summer. A meeting was recently held with the fruit shippers in Sacramento and arrangements made for carrying on the work, such funds as may be necessary to this end being guaranteed. If. Mr. Powell accomplishes half as much in preventing the decay of deciduous fruits in shipment as he has with citrus fruits, his labors wil be of inestimable value to the State. Some experiments on a small scale with grapes were made at the end of the last shipping season, and these gave good promise and encouraged the growers to further efforts this season, and it has been in response to the demand of the deciduous fruit shippers that Mr. Powell has widened his work in this State.

SUBTERRANEAN FRUIT PESTS.

Aerial insects, those which work above ground and in the open, are of comparatively easy control. We can reach them with sprays or poisons or caustic washes, and while it requires much trouble and considerable expense to control them, we can, if we please, hold them in check. Subterranean pests, however, are quite another matter. These are those which burrow beneath the ground and are safely out of reach of ordinary applications. In this group are the dreaded phyloxera of the grape, the wooly aphis of the apple, cut worms and the myriads of smaller pests which have been so far beyond our reach, and which have carried on their destructive work in spite of all our efforts to check them. The Cooper Research Laboratory of Berkhamstead, England, one of the largest and most reliable institutions of its kind in the world, claims to have discovered a preparation which will penetrate the soil and destroy subterranean pests as readily as sprays or gases will destroy aerial forms. This substance is in the form of a powder and is dusted over the surface and covered. It has been named "Apterite," and writing of it Professor Walter E. Collinge says: "Apterite is quite distinct from, and a great advance upon any of the so-called insecticides, for the active principle works upward and downward." If apterite will do even a part of what is claimed for it, it will prove one of the greatest boons the orchardists and agriculturists have ever had, for it is the underground pests which do the greatest damage at the present time.—San Jose Times.

CORRECTIONS OF NAMES.

In the "Cultivator" for June 4th there appeared a very interesting article giving both the scientific names and common names of our better known insects.

I want to call attention to a few corrections, however, that should be made. The Association of Economic Entomolgists has a committee which has been at work for several years securing all the uniform names for our common insects. This committee has from year to year prepared lists which have been submitted to the leading entomologists of the country for their consideration and approval. Such names as were unanimously approved were then submitted to the National Association of Economic Entomologists, and when unanimously supported by that body were finally recommended for exclusive use in all publications. A great proportion of our California insects have not yet come under the scrutiny of this committee. Thirteen of the names given in the article referred to, however, are of insects that have been officially christened, and eleven of these are incorrectly given in the article mentioned. The corrections are as follows:

Instead of cottony cushion scale read Cottony cushion-scale.

Instead of San Jose scale read San José scale.

Instead of Red scale read Orange scale.

Instead of Pear slug read Pear-slug.

Instead of Variegated cut worm read Variegated cutworm.

Instead of Codling moth read Codling-moth.

Instead of Hessian fly read Hessian-fly.

Instead of Bean weevil read Bean-weevil.

Instead of Pea weevil read Pea-weevil.

Instead of Plant lice read Grape-phylloxera.

Instead of Imported Chinese ladybird read Imported Asiastic ladybird.

These are only small matters, but since they have received practically uninanimous sanction of Eastern entomologists, they are worthy of our attention.

I might suggest also in reference to the scientific names, that naturalists are generallly now adopting Roman rather than the so-called English method of pronunciation, as given in that paper. This would agree with the present teaching of our high schools and universities.—C. W. Woodworth, Berkeley.

WALNUT GATHERING MACHINE.

The labor of gathering walnuts has been a material factor in the net profits of the crop and it is probable it will remain, but we note in the Orange County Tribune that a machine is now invented which will gather and hull the nuts. It is claimed that two men and the machine will gather as many nuts as 100 men in the old way.

The paper says:

This machine consists of a two-cylinder gasoline engine taken from an old automobile. The engine is hung between four wheels low to the ground, so as to get under the low branched trees. This truck, which the engine propels, carries the walnut picking apparatus. There is a large exhaust blower, producing about eighteen ounces to the inch pressure, working as a suction pump at the front. The intake divides into eight tributaries, each four inches in diameter. These suck up all the walnuts which come in their path, picking clean a swath six feet wide at about a four-mile an hour clip. The temporary derangement of one tributary will not interfere with the others.

The nuts, leaves and twigs thus sucked up are dumped into a large tank and the exit force of the blower separates the debris and bad nuts from the good ones and blows the waste material out on the ground behind the machine. The good nuts go to the huller, where they are completely hulled and the hulls blown away and sent through a long tube to a sack which when it receives a certain weight is closed and sewed automatically.

It requires but two men to run this automobile nut gatherer and it will pick more than a thousand acres in fifty days cleaner than men can do it. The machine does the work of 100 men, who would cost $9000 for the season, as against $550 for the new machine. Thus $8450 per 1000 acres is saved. The machine cost about $3000 to build.

GOOD FRUITS FOR CANNING.

According to Canner E. A. Francis of Hanford, the best varieties of fruit and vegetables to plant, given in their canning value, are:

Apricots—Blenheim, Royal, Moorpark.

Blackberries—Lawton, Early Crandal.

Cherries, black—Black Tartarian, Black Republican.

Cherries, white—Royal Anne, Centennial, Governor Wood.

Grapes—Muscat.

Peaches, free—Muir, Lovell, Early Crawford, Foster, Mary's Choice, Salway.

Peaches, cling—Phillips, Tuscan, Sellers, Lemon, Orange, Levi, California, Nichols.

Peaches, white cling—Heath, McKevitt, Winters.

Pears—Bartlett.

Plums—Egg, Washington, Green Gage, Gold Drop, Jefferson, Burbank, Silver Prune.

Raspberries—Red Cuthbert and Red Antwerp.

Strawberries — Longworth, Dollar, Linda.

Tomatoes—Stone.

Beans—Kentucky Wonder.

ENTOMOLOGICAL FIELD WORK.

From a letter from Prof. C. W. Woodworth, of the State University we learn that the entomological work in Southern California, which had to be suspended on account of shortage of funds until the beginning of the fiscal year was resumed the first of July under better conditions. The professor has succeeded in making arrangements whereby Prof. H. J. Quayle will devote his entire time to field work in Southern California with headquarters at Whittier.

In addition to this it is probable that Mr. Ralph Benton, Instructor in Bee Keeping, will spend his summer vacation at Whittier in the study of bee diseases.

VARIETIES OF GRAPES.

Continued from page 27.

we think, for the desert country, and will be tested at the date farm at Indio. It has large loose bunches of large amber colored berries. It can be packed as easily as Thompsons if handled properly. It bears as well, if not better, than any of the Persian varieties in the Pomona valley. We do not recommend any of the Persian varieties for any section except the desert country. It has been demonstrated that some varieties of the Persians produce well there and if half of them do, they are a great acquisition for they are, as a rule, very fine in quality and some of them exceedingly handsome. The last named is such and a black variety, the name of which is perhaps Askree (there is some confusion of the Persian names) is particularly handsome. Askree (?) is jet black, long and cresent shaped, set closely on the bunch. The bloom on the fruit of this variety looks like dead black velvet. The fruit is very sweet and crisp and crackies when being eaten. The bunches are uniform in size and shape.

Gross Colman is one of the best varieties for forcing under glass for out of season fruit. It has not been as good as many other varieties for vineyard culture in Southern California. It makes a fine show but the leaves sunburn badly when the vines lack sufficient moisture, which condition is quite common in unirrigated vineyards.

The following varieties are ripe in the last period and are good to eat from the first of November to New Years.

Persian No. 26 is a large white grape that hangs on the vines until the frost destroys the foliage. It is a shy bearer and cannot be recommended except for trial in the desert regions. It is a long pruner.

Golden Queen and Black Corinth are the two most prolific grapes on our light sandy soil. The quality of the former is good about the first of November. The fruit resembles the Muscat very much except that the bunches are more slender. These two varieties are good keepers. Laid on straw on trays and placed under the house, they kept till they shriveled up and were agreeable to eat at all times. Golden Queen is the best grape of the two. Both are long pruners. Black Corinth is not the black dried currant of commerce as grown in its native country. As grown at Pomona it is full of seeds.

Almeria is our latest grape and is perhaps the poorest in quality of any. It is a poor producer and will not bear at all if pruned in the ordinary way. When allowed plenty of long canes it does its best.

Cipro Nero is our latest colored grape and is very fine in quality; in fact, cannot be excelled by any of our earlier varieties. It does not mature till November, and heavy dews will crack the skin, consequently cannot be planted for shipping with any guarantee of saving the crop. It should be pruned either short or half long. Unlike most grapes it will not succeed on a trellis in the south, the vines refusing to make a satisfactory growth even on high stake.

Chassalas Rose is a small early pink grape that is very good for the home vineyard, but is not fit for commercial purposes, being soft and poor in color.

Olivette de Cadanet is an excellent grape, resembling Malaga somewhat, except that it makes a more symmetrical bunch and retains its fine qualities much longer after maturing. While it is a midsummer grape it will hang on the vine till New Years in the Cucamonga district where the winds cover the bunches with sand. This grape produces well when pruned short, but will do better if pruned half long.

Verdal is one of the most delicious grapes, ripening late in the fall and when the heavy dews gather on the fruit it glistens like silver balls. The vine is a vigorous upright grower and very prolific. It is a short pruner. Napoleon is similar to Verdal, but ripens a little later and is not so delicate in flavor. It is a vigorous upright grower and comes into good bearing the second year in the coast valleys. It is a short pruner.

Cinsaut is a very fine black grape resembling Black Malvoisie. It will not retain its good quality after maturing and soon is with little flavor. It is a splendid grape in its season, though. It is especially suited to dry situations where it is too dry for the most of the other varieties to mature fruit.

Black Morocco is a standard late grape and when grown where the second settings mature, brings fancy prices for the winter trade. This is possible along some of the southern exposures of the Southern California mountains, some growers selling most of their crop at five cents per pound.

Purple Cornichon is the best all round late shipping grape for California. It is strictly a table grape and fine for decorating, having handsome shape and bloom. It is very tough and will ship long distances and will not crack when rained on. It is a half long pruner. It does best on heavy land with a reddish subsoil.

PRUNING WALNUT TREES.

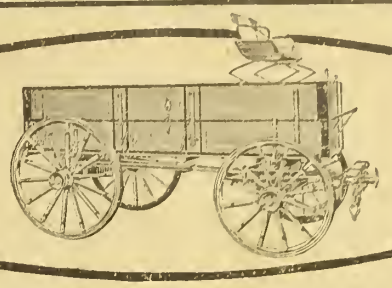
Judge Shanley has been engaged for several weeks past in pruning his walnut orchard on Lemon street, his purpose being to impart a greater degree of vitality to his trees. Instead of cutting back the trees and grafting to climinate blight, he thins out the foliage, believing thereby to save his trees from the shock of the cutting-back operation. Finding his trees too abundantly foliaged, he has taken out much of the inner growth, and hopes next year to witness the beneficient results of the process. He cuts out limbs irrespective of the nuts upon them, one limb taken out containing upward of fifty fine nuts. The idea is original with the Judge, and he is of opinion he is ahead of the cutting back and grafting method adopted by other growers. He has found little blight on his orchard this season, and thinks that if the disease fails to make an appearance soon, the hulls will be so thick the blight will not be able to penetrate to the nut. This new method of combating blight will be watched with interest by walnut growers throughout the valley—Anaheim Gazette.

PACIFIC COAST NURSERYMEN.

The Pacific Coast Association of Nurserymen has just issued its "Proceedings of the Fifth Annual" held last July at Salem. It has a fund of information for nurserymen. C. A. Tonnessen, of Tacoma, is secretary. Tannessen, of Tacoma, is secretary. The next meeting is at North Yakima, Wash., July, 8th.

Walla Walla valley will employ over a thousand pickers of cherries.

THREE HIGH CLASS FARM WAGONS



A FARM wagon has much hard work to do. It must haul heavy loads, travel over rough roads and be out in all kinds of weather. When you buy a farm wagon you want to get many years' service from it.

You will not be disappointed if you buy any one of the three wagons described below.

The 63-Year-Old Weber

The King of all farm wagons. Only the very best and most thoroughly seasoned wood is used; ironed to make a wagon that lasts a lifetime. Light running, convenient and a wagon of fine appearance.

The Popular Columbus

Built in a factory where most exacting conditions are enforced. Air seasoned wood stock, ironing which gives great strength and durability, workmanship by thorough mechanics and every part thoroughly tested.

New Bettendorf Steel Gear Wagon

Front and rear gears made of steel. Parts riveted together, not bolted. A wagon that is proof against breakdowns. Nothing can work loose or rattle, and there can be no warping, drying apart, shrinking or rotting.

You should remember above everything else that a cheap, poorly constructed wagon is dear at any price.

Before you buy any wagon call on the International local agents and learn all the superior points of the Weber, Columbus and New Bettendorf wagons. They will show you the wagons and hand you printed matter giving all particulars. Or if you prefer write nearest branch house for full information.

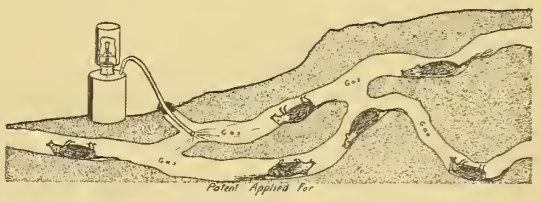
(Incorporated)

KILL

Pocket Gophers, Moles and Squirrels



More than 500 feet of holes flooded with gas in five minutes, at a cost of three cents, no pumping required, kills them by the dozen in a single operation. Not an experiment, but a sure destroyer of the pests; just turn on the gas and the work is done. Guaranteed not to injure vegetation. No danger. Any one can operate it.

Fully guaranteed. Your money back if it fails to do the work. Sent prepaid on receipt of price, with supply of carbide for ten acres, ready for instant use $5.00; without carbide $3.50.

Patent applied for. Agents wanted.

Write today for catalogue and description.

W. H. Lamb, Director in Bank of Santa Cruz County and Hardware Merchant in Santa Cruz, Cal., says:

I am sole agent in Santa Cruz County for the Rodent Destroyer. Am selling them rapidly and have never heard of one that did not give satisfaction. THEY DO THE WORK. The owners of the patent are reliable people.

W. H. LAMB.

Peerless Rodent Destroyer Co., P. O. Box 307 Santa Cruz, California

Placer Nurseries

We have now growing for next season's delivery a large stock of all leading varieties of trees and vines. We propagate only the best commercial sorts. Our trees and vines are the best that good care can produce and in their selection, propagation and growing we spare no labor or expense; and they are true to name. That is what you want.

Contract now the trees and vines you will want for next season's planting.

Write us.

Small Fruits and Vegetables

MULCHING.

WHENEVER the soil around a plant, be it flower, shrub or vegetable, is hard and caked, it is a sure sign that treatment of the garden is wrong. The average amateur will try to correct the matter at once by watering; indeed, that is all that most gardeners used to do when the ground was dry. Now-a-days we know that watering hard, baked earth is always useless and sometimes worse than that. When the earth cakes it is a sign that it has sucked up all the moisture from below and has allowed it to evaporate. What it needs immediately is to be dug up, hoed or raked and made as fine as dust. Very often, if it is impossible to give a garden sufficient water, as when the patch is far from the house or too large to soak as it should be soaked, you can refresh the plants without water by loosening all the soil around them and making it perfectly granulated and soft.

As soon as the earth has been loosened, water it freely, but not with a sprinkling pot. The sprinkling pot is absolutely out of place in a garden. It is useful for potted plants, but for nothing else. Soak the ground with a hose or pour water on it in pailfuls. Immediately following the watering, cover with a mulch.

What is a mulch? Anything that will cover the ground loosely and yet thoroughly. The most desirable for gardens is lawn-mower cuttings from the lawn, because it is not displeasing to the eye; but chopped straw, very dry manure, dry leaves and similar vegetable matter will answer perfectly.

If no vegetable refuse of any kind is available, street dust or house sweepings will do very well. Indeed, many growers prefer dust to anything else. Whatever is used it must be kept loose and light. Its object is to prevent the heat of the sun or atmosphere from reaching the ground underneath, and just enough must be used to gain this purpose and no more. The writer has seen coal ashes and even gravel used as mulch; they served the purpose, but of course only as desperate expedients.

WHEN WILL THEY COME?

Radish plants will begin to show above the surface in from three to six days after planting. One month after that the early varieties are ready to eat. Later sorts mature as late as 45 days after sowing. Lettuce plants will show in six to eight days. Their time of maturity, as explained in a previous article, depends so much on the variety that it ranges from one month to three. Endive sends up its first leaves five to ten days after sowing and is ready to eat in 45 days. Peas show in six to ten days and are ready for the table in 50 days in very early, 50 days in medium and as late as 80 days in the very late sorts. Beans appear in five to ten days after seeding and are ready to eat in about 50 days. Cabbage seed germinates in a week or ten days and matures in 100 days. Cauliflower shows first leaves in about a week and is ripe for use in about 125 days. Corn appears in a week or eight days and is ready to eat in from 55 to 90 days. Onions require a week or ten days to germinate and it takes 100 days for the early and as much as 160 days for the late varieties to mature. Pa nups come up in 10 to 20 days a are ready for the table in about 1 days. Turnips show first sprouts 4 to 8 days and can be used in fro 60 to 70 days. Celery is slow in a pearing, rarely showing its he above the ground before the seed h been in 12 days, and often failing appear for 20 days. It requires 1 days to get ready for use.

SPRAY FOR PLANT LICE.

"I once grew a magnificent crop peas in a year when peas of the enti country succumbed right and left a phenomenal outbreak of the pe louse, and my remedy was a ver simple one—hot water, some goo soap and some kerosene. I shaved u a cake of soap into a pail of h water and stirred it until the soa was thoroughly dissolved. Then, ta ing a quart of kerosene, I added pint at a time, and with an ordinar force pump churned the mixture fo a few minutes until the whole forme a milk-like liquid and there was n free oil. This kerosene emulsion wa then sprayed on to the pea vines wit the same force pump which had bee used in making it. Two such applica tions at intervals of a few days in sured a good crop of peas.

"All plant lice are found in greates quantities on the under side of th leaves, and the spray to be really e fective must be directed from belo upward. In buying a spray pum be sure to get one that will make th finest possible mist. Remember, i is diffusion of the oil, and not th quantity, that produces the desire result."

ASPARAGUS.

Perhaps one of the most nutritiou veegtables grown is asparagus, an even if only a small plot of land ca be spared it is surprising how man dishes may be taken through the sea son from it. This vegetable thrive in rich sandy or loamy soil, yet i will grow in almost any soil that ha been previously trenched or sub soiled and manured, and although i likes plenty of moisture, yet the lan should be drained to cary off any sur plus water.

If a small bed is to be planted, th soil should be removed to a depth o 5 or 6 inches, and the plants (2-year old if obtainable) set out at about 1 foot or 15 inches each way, takin care that the roots are carefully spread out and the crown of th plants fully 6 inches below the sur face when the soil is returned to th bed.

If an established bed is in the gar den, then the tops should be cut off and a good dressing of well-rotted ma nure forked in, care being exercise not to destroy the crowns of th plants. If a dressing of salt (coarse or kainit is made it will also help t improve them.

Tons of Paris green are yearly wasted on plant lice. You can' poison this kind of pest, because i takes its food directly from the in side of the plant; but, fortunately, i can be choked off. None of thes creatures can breathe if they ar once coated with a fine covering o some oil or oil emulsion, for insect breathe through trapdoors on thei sides, not through their mouths.

The poorest seed one can sow i that which brings discontent to th sower or to some one else.

The Ornamental Garden

BEAUTY OF THE FLOWER BORDER

THE arrangement of the flowers on the home grounds counts for as much as the kind and number of flowers themselves. A yard may be full of flowers, and yet not be beautiful.

There may be a few flowers in the same yard, and still it may be very beautiful. The way the flowers are arranged makes the difference.

Where shall the flowers be planted? is a question with many. The answer is, plant them where they will show beauty in themselves and at the same time enhance the general beauty of the dwelling and grounds.

To accomplish this, they must not be planted in a haphazard way,—a clump here, a bed there, and a straggling mass somewhere else. Also, never plant so that one plant or mass hides another. Plant with the design of unity and harmony.

The best place for flowers is in border along the side of the yard or around and close to the base of the dwelling-house. In this way they are more out of the way, are as easily cultivated as otherwise, and they help to frame and unify the setting.

A border of flowers along the base of the house is in easy reach for care and cultivation, and it enhances the appearance of the structure, broadening its base and harmonizing it with surrounding natural objects.

The outer border along the side fence or between the front and back yard should be filled with the larger and more showy decorative plants. It should be planted with the larger ones next to the fence and the smaller ones in front of them so that none are hidden from view.

The flower border may be straight or curved according to the place it occupies, but the best effect is produced by making the margins irregularly curved since natural lines of planting are that way.

A single border may be of one kind of plants or of many kinds. Where different kinds of plants are used, avoid such placing as will produce discord of colors when the plants come into bloom.

The mixed border is very interesting and may be made beautiful if proper skill is used in grouping the plants. Many plants are effective in individual borders, among which are asters, salvias, calladiums, hollyhocks, irises, cannas, hydrangeas, and the hardy perennial phlox.

The lawn is the principal part of the home grounds; and no planting, whether of flowers, shrubs, or trees, should mar its unity or scope.

By massing the other plants in borders the lawn is unobstructed for use and has a full chance of an abundance of direct sunlight and air, without which it will not thrive nor will the soil it occupies be a healthful place for human living.

Let the lawn be one unbroken mass of grass plants, and mass all other plantings in borders where they will not interfere with it but where they will be just as beautiful in themselves. —Farm Journal.

When you see spots on your rose leaves be sure Mr. Red Spider is at work. He is so small you can hardly find him, but he is there on the under side of the leaves. Wash the plant in quassia-chip-water.

NASTURTIUMS.

The climbing nasturtium has come into much popularity during recent years. In raising the plants much better progress can be made by starting the seeds in the house early in the spring and getting strong plants to set out when the weather has become steadily warm. They will do well, however, if the seed is sown now in the garden where the plants are to remain. If sown thickly in a line and given a string trellis they will make a fine screen, showing a mass of brilliant colors. They also make excellent pot-plants and by starting them at different times and with proper management they may be kept in bloom the year round. A heat of sixty degrees is sufficient and too high a temperature is undesirable. Plenty of air is also one of the requisites for strong, healthy growth, for if kept close and in a high temperature the plants become drawn and poorer both in foliage and flower.—Field and Farm.

IN THE GARDEN.

DESTROYING THE ROSE APHIS.

Many rose growers will be glad to know how to combat their worst enemy, the rose aphis. By following one of the suggested plans they will experience no difficulty in destroying them. One of the easiest ways to free your plants, providing you can arrange a receptacle to cover them up practically air tight, would be to use the fumes of nicotine, nicoticide or some other preparation of tobacco. Some of our growers have arranged a little canvas box or tent that can be taken into the garden and placed over infested plants, and after it is carefully closed up they burn a small quantity of tobacco stems, dust or cheap grade of tobacco under this canvas and kill the aphis by smoking. If the burning of the tobacco is slow it produces a much stronger and more effective smudge than where it burns fast. There is no danger of injuring the plants, unless you make it very strong, and this is not often the case where smudging is done outside. The liquids of tobacco, such as nicoticide and nicotine, may be evaporated in a tent or box by an alcoholic lamp and similar results be obtained. However, this arrangement is not possible where the plants are grown on porch posts or against the side of the house, so we must resort to some sort of a spray. Probably the best spray to use in a case of this kind would be a spray of one ounce of fir tree oil to one quart of water. This seems rather strong, but it is one of the most harmless things to use on plants and yet one of the most effective insect destroyers I can recommend. The fir tree oil would be too expensive for general spraying of large trees, but such plants as roses, palms and other house plants can be very economically sprayed with it. It can be secured from the florist or city greenhouses. Another good spray is a strong decoction of tobacco and water sprayed on the plants with lots of force. All of these sprays must be applied under pressure with a good spray pump. Do not attempt to sprinkle your plants and expect the insecticide to be effective, especially where the insect is being killed by a contact spray.—Western Farmer.

GOLDEN FLOWERS.

A generation ago yellow flowers, though they made gay the old-fashioned garden, were just a bit in disfavor among the most fastidious. Today they hold a prominent place in all decorations. This is partly due to improved varieties, partly to change in taste, but more to the exquisite settings now given in arrangement. The boquet of long ago had in it a bit of everything contained in the garden. Little wonder that yellow, blended with all the other colors of the rainbow, lost its attractions! The rich shades massed in a nook by themselves were ever beautiful.

No one who has seen the Bartonia in blossom will say that there are no handsome yellow flowers. For rich satin finish, intense coloring and exquisite arrangement of stamens and other parts, this flower is almost without a rival. The light gray foliage so characteristic of yellow flowering plants is in charming contrast with the gay blossoms.

The large flowering yellow Aquilegia, a western species, is one of the most beautiful in form and color. Planted in the background with shrubbery, its graceful golden blossoms are most appreciated.

Calliopsis or lady's breastpin, grown in mass, produces a wealth of blossoms in all shades of gold and brown, the long and slender stems rendering it fine for cutting. The tall varieties make the most effective screen.

Eschscoltzia or California poppy lays special claim to the golden hues, and never was the color more royally bestowed upon these blossoms. Here we have again the soft gray foliage setting off to their best the flowers, whose sole defect seems to be their ephemeral character.

But the durability is not lacking in yellows, as the calendula bears witness. For all through the summer and long after the other garden flowers have faded this sturdy plant sends up new heads of orange or gold. Like the dandelion of the field it is the last of the annuals to leave. Many are the beautiful forms among improved holllyhocks, but none are more admired than the soft yellow, double as a rose.

Hunnemannia, similar in appearance to the California poppy, has this marked superiority: The flowers keep in water several days. It blossoms from August till November, a period when drought or frost renders continuous blossoms all too rare.

Some of the marigolds, especially the smaller French types, are effective in masses, the color being rich and texture velvety.

The nasturtium is another flower in which yellow, cream, gold and orange are exquisitely combined, and one has only to scatter a packet of mixed seed and let nature do the rest.

Pansy, Salvia, Scabiosa, Thunbergia, Portulaca and Larkspur have each good representatives in the golden hue. On the other hand, a few flowers, like sweet pea and hyacinth, are chary of giving it their best, yet of yellow flowers we have a goodly number.—Ex.

Begonias should be grown in soil made of partially rotted sod, sand, and good manure in equal parts. Nothing better.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

MORE MILK—MORE MEAT

IF YOU USE LILLY'S BEST FLY KILLER

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.

Live Stock and Dairy

JULY, 1908.

THE conditions this year of scant rainfall have to be met by the farmers by growing extra soiling crops and by frequent irrigations. All farming must be intensified. Alfalfa hay costs $9 to $10.50 in the barn this summer; even foxtail hay is selling for $4 in the field. New barley is finding slow sale at $29 a ton. The farmers are wondering, with the high prices of feed and labor and the low prices of fruit, where they are at. Even the farmers that are selling alfalfa hay and barley are not making the usual amount of money, as both crops are very short. All this loss comes from four weeks of unseasonable drought. At the very time when the rain clouds should have been their busiest, the sun was shining brightly and the earth drying up. Rainmaker Hatfield, too, was at work over on the West Side, but in vain for Rainmaker and signs alike fail in dry weather. The rainmaker has been engaged for next year.

Allah makes the mango,
The farmer shakes the tree,
Allah cures the patient,
The doctor takes the fee!

Pedigreed Corn.

The Eastern silage corn planted in April is now in the silk and stands thick on the ground. It is not as tall as the corn grown from California seed. The California corn has not tassled as yet, so it is really slower growing and later than the Eastern corn. The tonnage of the whole plant of the Eastern corn promises to be a third heavier than the California, as the leaves are much wider and longer and more on the stalk. It looks as though there would be little seed corn for the neighbors like roasting ears early like this; I hope, however, they will finally leave enough to plant next year. Three irrigations were required to bring this corn up to the present stage of growth; constant cultivation has kept the soil moist between the irrigations. This corn growing brings the land into fine condition to plant the alfalfa next season. The foxtail seeds already in the land will have sprouted and been turned under as grass. The sunflowers and cockle burrs have been put to shame for their greedy growth has proven their undoing and they have gone under the earth to make room for the tiny alfalfa seed to grow untrammeled into a robust plant.

Sorghum.

This is, indeed, the farmers' friend; planted in early April, it is slow in making its first growth, but is now reaching up rapidly and the first crop will soon be ready to cut for the cows. The sorghum will make hay if not fed green or it can be put into the silo. We have a good stand of sorghum on a field of morning glory. Do you know California morning glory? I hope you do not! It may prove a blessing in the end, for the cultivators and weed knives going over it all the time are helping the land. It may be like the moral of the old story, of the old man who in dying told his lazy sons that he had buried a pot of gold in the little vineyard. They dug and dug and dug and still dug and not until the crop was harvested did they understand where the pot of gold was hidden. The morning glory is cut over as soon at it shows up, with a weed knife. Shorty said, the other day, that the man that drove Laura Jr., and Leona on the weed knife was having a happy time as he walked the fields of glory from morning to night each day.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Smother.

The successful suppression of the weed growth in California is found in smothering them out, either by constant cutting off of the tops or by growing a dense crop on the land. The sunshine must not reach the leaves of the weeds at all, for when they are young they are tender and weak like any other babies. Either smother them with an earth mulch or with a cover crop of great density. On the clean land put the pumpkins and beans. I have them in the long rows between the young trees. This is considered wrong in theory; but in practice, if you add fertility to the soil to balance that removed, it does not seem to be terribly injurious. After the plows and harrows have finished their effective work, then come the cultivators; but at last comes the day for them to be laid aside. The dust mulch is completed. After a few days a little green growth will be noticed coming up in the vineyard rows. It is time for the weed knives to glide through the surface below the top an inch or two and slice off the weeds at their roots. The loss of moisture and fertility is stopped right there with each weed that is slain. Weed growing instead of fruit growing does not look very profitable.

Millet.

Is a good catch crop for hay or silage. It can be fed green, also used as a soiling crop. The disadvantage of using it for soiling is that it grows old faster, usually, than it is fed off. The hay must be made before the seed elopes. It has a single, well guarded seed like the foxtail and the barbs are nearly as destructive. Millet made into hay from early cut growth, is more digestible than timothy and has a little greater food value. We are drilling the German millet seed in rows in well cultivated and irrigated land, using about forty-five pounds to the acre. Millet is a rather shallow-rooted plant and is considered hard on the land; it certainly is if the land is not fed. Millet does not object to manure put on with it in the seeding and if the fertilizer is put on with the seed it will produce very finely. Millet hay, if at all mature, will seriously affect the kidneys of horses, while it seems to have no serious effect on cows or pigs.

Growth.

The leaves of the German millet are broader than those of other varieties, while the heads are often an inch in diameter. Where millet is used for siloing, it is usually thirty-five to forty days in reaching its growth. It is expensive to grow, as it is an annual and the seed costs six cents and upwards a pound. Its value is not worth considering when one has plenty of alfalfa; its only value is in its use as a catch crop to help out a year of drought.

Varieties of Millet.

barn yard (Panicum Crus-galli) and broom corn (panicum millieccum) are the varieties in cultivation in this country and Europe. Foxtail millet sounds rather disreputable to California ears; it is named from the single spike of the head. This spike is fully as viciously barbed as the common foxtail. Under this name are classed Hungarian, German and common millet.

Common millet is the earliest and also grows on the poorer classes of sandy soil better than either the German or Hungarian varieties. Hungarian comes in between the two other varieties in season; it stools very freely and produces a fine stalked and better hay than either of the other varieties.

German millet is ranker in growth and requires better soil; it is the heaviest producer of the three varieties. Barn yard millet comes from Japan. it is used rather for green feeding or making silage than for hay. It makes a hay that the cattle will hardly eat, as it is coarse and ill-flavored. This form of millet is catalogued by the seed men as "Billion Dollar Grass." Broom corn millet is hardly known in the United States, but is greatly used as a grain plant in Europe.

Allied Plants.

There are some plants that are considered as millet by most people. Teosinte (Euchlaema Mexicana) is more nearly related to the common field corn than to millet. It grows well in any hot country. The San Joaquin Valley and Imperial Valley are good places for its growth. It has great value as a fodder plant. It is, however, distinctly inferior to sorghum for soiling and for grain, Indian corn far outranks it in production. The other millet is called pearl millet and has little to interest us as a fodder plant.

All the true millets are hot weather plants and are only to be considered as catch crops in California. Where alfalfa and corn will grow to perfection the millets cannot be considered as staples. They can be planted as late as August and yet produce good returns for either green feeding or for hay. They have an advantage in that they will make a crop on land that has been producing wheat hay or oats and peas, with less allowance of water than Indian corn. Wisely used, they, like ourselves, fill their own place in this mundane sphere.—M. E. Sherman.

CONGESTED UDDER.

When the cow is suffering from congested udder it is a good idea to dry her off at once and feed one-half ounce of nitrate of potash night and morning in the soft feed. Give plenty of clean water, feed pure and wholesome food, and massage the udder once a day with a little iodine treatment.

I think many have made the mistake of breeding heifers too young, and this has had a tendency not only to dwarf them in size and constitutional vigor, but in their power to digest and assimilate large quantities of feed to be converted into milk. Grow them well; and if a heifer, after having been bred, lays on considerable flesh don't get frightened. If she has been bred right, "blood will tell," and when she comes to freshen she will need all of this surplus flesh to tide her over this period till she gets into good working condition.—F. H. Scribner, H. F. Register.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

THE HEALING OF WOUNDS.

Animals on the farm are continually being injured by accidents that happen in a thousand different ways, writes George H. Glover, veterinarian, Colorado Agricultural College. Barb wire cuts are most frequent and a word or two of advice as to the proper treatment in the hands of farmers will not be amiss. The first thing to gain a correct understanding of a sane and effective method of treating wounds is to remember that nature does the healing and that remedies applied are simply for the purpose of assisting nature. The right mental attitude in this respect will tend to eliminate a thousand and one nostrums which are tried in rapid succession in the belief that there is somewhere, if it could only be found, a specific remedy with magical influence to bring about the desired recovery in a marvelous way. Mankind has been diligently seeking such remedies for thousands of years and is still keeping up the search. It is time that such a view of the situation, which is based purely upon superstition, should be eliminated, and that we get down to principles based upon scientific research, and instead of groping blindly in the dark, seeking the "where," let us always be ready to inquire "why."

The ordinary wound will heal of itself if not interfered with. This interference may be from germ infection, parasites or too much meddling with various applications on the part of man. Now, let us suppose a case. A horse has a badly lacerated leg from contact with a barb wire. The first thing to do, of course, would be to stop the bleeding. This can be accomplished by a tight bandage of clean, white muslin, tied directly over the wound or above it. Often the bleeding artery will protrude, and a thread can be run under it with a needle and the artery tied. Do not use flour, dirt, or cobwebs or anything of that sort on the wound; they are unnecessary and may produce a dangerous infection.

Having stopped the bleeding, remove the clots of blood and cut off the ragged edges of muscles with shears. A pan of antiseptic solution should be provided. One of the best and cheapest antiseptics on the farm, good for man or beast, is Creolin. Add a teaspoonful of this to a pint of water that has been boiled. Place the knife, shears, etc., in this solution, and wash the hands before beginning. After having cleaned out the wound, wash it thoroughly with the antiseptic solution. See that there is good drainage from the wound at the bottom. Do not allow it to start healing with a pocket that will hold pus. As it is practically impossible to keep a wound on a horse antiseptic, it is not advisable for the farmer to tie up the wound; leave it exposed to the air and apply the antiseptic wash several times a day. Three good antiseptics are, corrosive sublimate, which can be purchased at the drug stores in tablets all ready for use; formalin is good, as is also a solution of boracic acid. After about a week, it is well to change to dry dressing, a powder composed of equal parts of boracic acid and charcoal and iodoform makes a very good dry dressing. Clean, air slaked lime, powdered over the wound twice daily, is very satisfactory. The so-called "proud flesh" is only unhealthy granulation. It is seldom advisable for the farmer to interfere with this condition by using caustics; the results are really disastrous; better in this case to call in a qualified veterinarian. If maggots should get into the wound, a little turpentine or chloroform will help bring them to the surface, where they may be picked out. I did not mention sewing up the wound, for the reason that in case of the ragged barb wire cut, it is very seldom worth while to do so.

A wound ,to heal properly, must be gotten perfectly clean and free from germs from the start and then kept clean. Remember that it is largely a matter of keeping dangerous germs out and giving nature a chance. Too much interference is often the cause of tardy healing of wounds.

A mixture of equal parts of licorice and ginger in the hog feed two or three times each day is recommended for the pig that coughs. A lump of coal tar placed well down the throat while the pig is held up on its hind feet is also good.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.

BUMPER CROPS

De Laval

CREAM SEPARATORS

With the finest crop prospects ever before American agriculture—big crops of all kinds practically assured in nearly every locality and a world wide shortage of grain and other food supplies that insures good prices—there never was a better time to make that most profitable of all farm investments—the purchase of a DE LAVAL CREAM SEPARATOR.

Nobody who has the milk of one or more cows to separate can have good reason to delay making this investment, nor for being tempted to try "something else"—with the wide gulf of difference in every practical way between the new and improved 1908 De Laval separators and any other possible means of cream separation.

A De Laval separator tells its own story best. Order direct or through the nearest agent. A catalogue, to be had for the asking, is the next best thing.

NOT A NEWSPAPER.

A subscriber has called the attention of the Cultivator to the fact that the death of one of the great men of this nation, Grover Cleveland, had received no mention whatever, while the passing of Alexander Craw whose sphere was largely within this State and the Hawaiian Islands, had received extended notice. This served to call our attention to the fact that many people think that our field is almost universal. The fact of the passing of so great a man as Grover Cleveland was not ignored because of any personal or political question. That is not allowed to enter into the conduct of the Cultivator. It was a case which was handled so extensively by all the metropolitan and most of the country press that it did not call for mention from a paper which is purely agricultural. On the other hand, with Alexander Craw, known to every agriculturist of this State, and who has been so vitally concerned in its welfare and done so much for agricultural interests, it is most fitting that an agricultural paper should tender its tribute.

True, this paper did mention the work of the Republican Convention in nominating Taft and Sherman as the leaders in the present political campaign as it will also next week refer to the nomination of Mr. Bryan and whoever is nominated for vice-president on his ticket. These two events might have been passed without mention in our columns perhaps, but as they have bearing on our agricultural interests in a way which will be freely discussed by all within the next few months the mere mention of the fact in our columns was considered proper.

Meantime, we will endeavor to keep the Cultivator in its chosen field, which is that of cultural agriculture and horticulture.

A SIGHT WORTH SEEING.

The following from the Imperial Standard is an indication that the world does move out here in California:

Monday morning a freight train with 63 cars, all loaded with cantaloupes picked up at Holtville, Heber, El Centro, Imperial, Keystone and Brawley, left the latter town, driven by two engines and bound for Eastern markets.

It is but five years since, over practically the same route, twenty-mule teams wended their way, bringing supplies to the same valley which now sends out this immense quantity of high class produce—produce which in one day's shipments represents values of probably $75,000.

And while there are from sixty to seventy-five cars of cantaloupes a day leaving the valley there are a half dozen engines at work bringing in cars to be filled and spotting them where wanted for loading, while a trainload of miscellaneous freight is brought in each day and many cars of other products of the valley are sent out. Two trains each way a day carry a mail coach, two express cars and two or three passenger cars.

All this traffic is maintained on a little road forty miles long in a territory which was without a single inhabitant eight years ago.

The beauties of California and its world of latent opportunities have been the theme of editorial and other writers, but never was there a better illustration of the possibilities of the reclamation of the waste places of this land of opportunity.

OVERPRODUCTION.

As a rule, the production of fruits and agricultural products is not overdone, but occasionally the farmer becomes elated by large profits of some special crop and everybody proceeds to "follow the leader." This has been the case this year in Imperial valley with cantaloupes, though it may not be said to be entirely a case of overproduction so much as a combination of that with a shrinkage in purchasing power in the Eastern markets. But in any case the vast increase in the melon acreage has met with disappointment which, in some cases, will be almost equal to disaster. Such movements should be discouraged so far as possible, at least to the extent to which they are followed in the Imperial valley. It is hard to tell how it can be done, but the growers should organize and formulate some plan by which a canvass of the situation could be made and knowledge gained as to the extent of the production and, so far as possible, of the probable demand.

It is reported that some who invested their all in cantaloupe culture this year will lose almost the entire amount.

The people of Coachella valley are also in a similar state as to their onions, but in that there is a much larger production of onions in Texas than in California, which makes the field much larger for control.

FIRE.

The season is now with us when it behooves every one in this State to be careful with the handling of fire. Whether it be in the home, at the barn, in the grain fields or still more in the forest, the greatest of care should be exercised. In looking over the exchanges which come to our table from every part of the State, no week passes in which we do not observe account of a grass fire in one section, or field fire sweeping over thousands of acres in another, or still more often where the hills have been deprived of their covering of brush, and sometimes of forests by the sweep of a forest fire which runs for miles before it burns itself out.

California is only awakening to the fact of the vast loss which is ocasioned by these forest fires on our water sheds. The government and the State, and sometimes the counties are combining to reduce this fearful loss as much as possible, by appointing fire wardens, but excepting the people take an interest and uphold the officials in this matter the greatest good cannot be accomplished. Let every camping party exercise greatest precaution that no fire shall ever be allowed to escape from its proper boundaries, and especially that no live embers shall ever be left when camp is broken. Besides, when the fire has once started let every one who can, aid in every way possible.

INTERNATIONAL IRRIGATION CONGRESS.

Elwood Mead, formerly chief of the Irrigation Investigation in the Department of Agriculture, and now chairman of the State Rivers and Water Supply Commission of Victoria, Australia, is urging the holding of an international congress of irrigation and water conservation. This, he urges, should be held in the city of Melbourne and gives as his reason that Australia, and especially Victoria, is far ahead of the United States, and most other countries in its irrigation laws. On the other hand, he admits that American irrigation engineers are better qualified than those of any other section of the world.

Mr. Mead's idea is that the bringing of the bright men of America and other sections where irrigation has become almost perfect in its engineering problems together in the country where irrigation laws have become almost perfectly administered, will be a great advantage to all.

Sure it is that if anything could be brought about which could give a more satisfactory set of laws than California now has it should be encouraged.

For the first time in years the Los Angeles Chamber of Commerce has decided to make an exhibit at the coming State fair. Such a step has been urged by the management of the State fair for years on the ground that it was due to the agricultural interests of the State that the southern end of the State be more generally represented than in the past. The distance away has been the objection observed, but we are glad to know that it has been shortened to that extent that the south will come up with a creditable exhibit. This we know to be true because the Chamber of Commerce has never taken a step in such a matter in a half hearted way.

The "spotless town" war which has been spreading on all sides, is one well worth imitation by people living in the rural districts. It has been found that parks, well kept streets and a general cleanly appearance on all sides, increases values and draws people of the best classes to the cities. If this be true of the cities it will be still more true of the country sides. Let the people of the country organize improvement associations which will take a pride in making every community just a little bit nicer than its neighboring community, and we will soon have our State more talked about than ever before.

Regarding issuance of permits for keeping pheasants in captivity, Chas. Vogelsang, Chief Deputy of the Fish Commission writes: This Board is liberal in its interpretation of the law, especially when it makes for the preservation of the species. A great many have taken up pheasant culture with marked success. Out of our hunting licenses we will shortly establish a game farm to hatch and distribute for the general good, pheasants, partridges and other wild birds, and possibly animals.

We do not know how much the farmer receives as rental for ground occupied by bulletin boards proclaiming the merits of Spoopendike's little liver pills, but trust it is great. Those things are a blot upon the landscape which should not be permitted, and the farmer who will consent to it certainly must receive good returns. We hope a time will soon come when farmers will receive liberal enough returns from their crops that they will not be compelled to sell the sightly locations on their ranches to be prostituted in this way.

It is estimated that the Texas fever tick will be responsible for about $40,000,000 loss annually to cattle owners of this country. This awful loss should give impetus to the effort to stamp out the pest. There have been occasions where damage has resulted to stock which has been dipped in the various solutions. The recent example at Santa Ana where stock died after dipping should call for thorough investigation, but should in no sense discourage people from continuing the effort to wipe out the tick.

Agricultural Notes of the Pacific Coast

Northern California

A 3000-acre tract near Chico is to be cut into farms this year.

Irrigation is more general in the Sacramento valley this year than ever before.

Tehama county has a mill constructed for the manufacture of alfalfa meal.

Marysville is shipping large quantities of cucumbers by express to Eastern market.

Big forest fire on the Wetterau ranch below Sacramento recently did much damage.

Berry growers of Gold Ridge district, Sonoma county, recently held a meeting at Sebastopol.

On some of the sheep ranges back of Red Bluff the snow remained much later than usual this spring.

The members of Sonoma County Pomona Grange were royally entertained at Sebastopol recently.

Many sections of the Sacramento valley claim that pear blight is showing less virulence than usual.

The bridge across Willow Creek at Willows was destroyed by too heavy a load of cattle being driven over recently.

The harvesting season now well on at Gridley shows that the output of grain will be much in excess of earlier anticipations.

More than 100 boys have been sent by the Boys and Girls' Aid Society of San Francisco, to the berry fields of Green Valley.

Grain crops of District No. 7 near Yuba City are exceptionally good this year, some of the barley running 20 sacks per acre.

A large amount of machinery has been assembled in the creamery building at Davis, and its installation is now in progress.

The importation of plants brought by special agent, Meyer, from Asia, made a freight shipment aggregating over 15 tons of plants.

The Sutter county horticultural inspector reports energetic campaign against the blight, and that it is much less in evidence than in the past.

Fairoaks is rapidlly becoming a beautiful surburban section. As one paper expresses it, it will soon be the Pasadena of Northern California.

Action is to be taken by the supervisors of Yuba county against miners who are dumping debris from the hydraulic mines into the Yuba river.

Fruit growers about Loomis, Penryn and Newcastle, are complaining that various deciduous fruit shipping concerns have combined to their injury.

Tehama county apricot growers are complaining at the depredation of coons which make nightly raids in some of the orchards and destroy much fruit.

Cling and free stone peaches about Marysville will not yield as heavily as anticipated. It is predicted that the total shipment of Yuba and Sutter counties will not exceed 3000 tons.

Articles of incorporation of the new Feather River Canal Company were recently filed in Butte county. This canal when constructed will open up an immense fertile country tributary to Oroville.

Central California

Tulare is building a new winery.

Hay market of entire valley seems to be remarkably quiet.

One wheat field of 1000 acres near Angiola yielded 9500 sacks.

The Exeter Sun is appealing for better care of orange groves.

Turlock apricot trees are literally breaking with the load of fruit.

Thousands of acres were burned in a grass fire in Eastern Kern county.

Five new packing houses are being constructed at Watsonville this year.

One grower at Tulare will produce about two cars of onions this season.

Orange growers are pleased at the recent drop in the cost of orange boxes.

Turlock has produced quantities of exceptionally fine strawberries this season.

Modesto delivers some of its fruit to the Pacific Pea Packing Company at Turlock.

Good raisin weather is now being given to the growers of the San Joaquin valley.

The Turlock Journal appeals for a better pack of cantaloupes during the coming market season.

"The best crop of hay I ever raised" is the verdict of a grain grower of Salinas valley.

Farmers in the Terra Bella district are complaining bitterly of great damage from ground squirrels.

The Oakdale Milling Company at Turlock has increased the capacity of its mills to 1000 sacks a day.

Watsonville papers are appealing for more careful handling of the apples and more uniform packing.

Future prices are not made on prunes as yet and the market shows no desire to become very active.

The output of green deciduous fruits in California is more than double that of last year at this date.

An extensive grass fire burned over 1000 acres of land, 800 of which were in barley hay, near Tulare recently.

Forty tons of alfalfa hay were recently destroyed near Porterville, supposedly from spontaneous combustion.

Central California Produce Company of Turlock has shipped a car of Early Rose potatoes to the State of Washington.

A distillery at San Jose produces alcohol to that extent that its internal revenue payment averages $11,000 per day.

A farmer near Tulare has been arrested for cutting a ditch and taking water which it is claimed did not belong to him.

Hundreds of men and teams are at work in the fields near Tagus, and beets are being delivered at the Visalia factory.

Kings River has a flow of two million acre feet of water annually. It is eighth in list of California rivers. Sacramento stands first with 12,420,000 acre feet.

A meeting of citrus growers of Tulare county was held in Lindsay recently at which it was strongly recommended that the shipping of green fruit be discouraged and that it be held on the trees until fully sweetened.

Southern California

Fruit dryers at Redlands are busy on apricots.

Some aphis infests cantaloupe fields, but less than formerly.

Ventura county output of apricots will be the biggest in its history.

Redlands apricot crop will exceed fifteen hundred tons of green fruit.

Some Imperial cantaloupes are sold as low as $1.00 per crate in New York.

Output of cantaloupes from Imperial valley has been greatly reduced by unsatisfactory prices.

Brawley potatoes have done exceptionally well this year. Producers are receiving fair prices.

The San Bernardino mountains back of Redlands were visited by severe forest fires last week.

The Riverside Enterprise appeals for enforcement of the law, demanding full weight of butter rolls.

Tustin Lemon Packing House is an active place these days, being busy to its utmost capacity shipping fruit.

The government is to spend $25,000 in developing water for various Indian reservations of Southern California.

Many cantaloupes are shipped from Imperial this year and sold at New York for prices less than freight and packing.

Antelope valley reports that the crop of almonds this year will be a bumper one, probably the largest in its history.

It is reported that Secretary Garfield intends to set the farm unit for homesteaders under the Yuma Irrigation project at fifteen acres.

Los Angeles county is inaugurating a campaign for good roads, and has called an election for July on the question of $3,500,000 bonds.

Dispatches from Eastern orange markets show that the success of the pre-cooling plants used in the orange industry this year has been complete.

Orange county grain growers have been offered as high as $1.37½ per hundredweight for the entire crop of barley. This is in advance of last year's prices.

Owners of cattle in Orange county, which died after dipping under direction of the county veterinarian, are to institute suit to secure recompense for destroyed stock.

Walnut outlook is still very promising though the earlier moist weather permitted the development of some blight. Some groves are dropping nuts quite badly.

Bloomington packing house shipped 105 cars of oranges this season, which is a large output for a small house. An addition to the plant will be made before another season.

The Antelope Valley Gazette reports the success of a lady in goat raising who started raising goats some years ago, having at that time only eight. Last year she made a sale of 2300 goats, the increase of the eight.

It is reported that the committee recently appointed to recommend horticultural laws for enactment at the coming legislature will recommend a law favoring that the horticultural commission be reduced from three members to one.

The Coast

Milton, Oregon, has shipped berries to the value of $50,000.

Haying in Eastern Washington began about the middle of June.

Clarkston, Washington, is marketing an immense crop of cherries.

The Dalles, Oregon, held a most satisfactory cherry fair last week.

Eugene, Oregon, has a new cannery, one of the largest in the State.

Strawberry crops near Wenatchee have been the biggest crop ever raised in that section.

Many farms about Quincy, Washington, will be irrigated from artesian wells now being sunk.

About 25 per cent of the crops about Walla Walla have been ruined by cold winds and lack of rain.

Grain men of Northern Idaho, especially near Lewiston are preparing for the largest yield of grain ever in its history.

At Creston, Washington, the entire town turned out to greet the farmers' educational train even the stores of the town being closed.

One wool grower at Billings, Montana, has a clip of over a million pounds, and his check for this season's clip amounts to $155,000.

Hundreds of acres of prunes will be grubbed up this year in Oregon, and the land will be planted to walnuts. The Franquettes are the favorite variety.

While the farmers and politicians are disputing over the appointment of an inspector at Kiona, Washington, fruit pests are running riot in the orchards.

Farmers at Hood River who were greatly damaged by the destruction of an irrigation flume are threatening all kinds of vengeance if they can find the culprit.

The farmers' educational train over the Central Washington branch of the Northern Pacific has been a great success and was warmly received by settlers along the line.

It is claimed that a wheat has been bred in Northern Idaho which will yield 200 bushels per acre, but, as a rule, farmers who hear the story all seem to be from Missouri.

A hundred thousand trees are being planted on the forest reserve near Pike's Peak. This is the first planting in the great scheme for 20,000,000 trees on that one reserve.

Oregon has a law that all boxes of fruit shall be marked with the section in which the fruit is grown, which the fruit inspectors of the State are rigidly enforcing.

Dairymen near Seattle, Washington, are incensed at the rigid health laws which discriminate against dairy products. They charge that the law makers have gone microbe crazy.

Many cherry growers near Seattle, Washington, have made the mistake of planting a variety of cherries which are proving poor shippers and arrive in the market too soft to sell.

Eugene, Oregon, is shipping a large quantity of cherries this year, and in order to secure best prices is putting up a handsome pack. She has brought from California an expert packer to supervise the packing of her fruit.

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Coulson's Cresolene

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company
Petaluma, California
Germain Seed Co., Los Angeles, Distributing Agents for So. Cal.

Little Chicks should be fed on Excelsior Chick Food

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

Excelsior Cereal Milling Company

242 Central Ave., Los Angeles

MY BOSS MAKES MONEY

Because he raises poultry in the Inglewood Poultry Colony. Eggs bring a higher price there than they do anywhere else. If you are going into the poultry business, go in right and get a farm in the Inglewood Poultry Colony. Address for particulars

Inglewood Water Company
349 Wilcox Building Los Angeles, Cal.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

KEEP SMALL FLOCKS.

TWENTY-FIVE hens in a flock, the individuals of which lay 150 eggs in a year, is a much better investment than a flock of fifty that lay only seventy-five eggs each in the same time. We have got as many eggs from the small flock as the large one and have saved the feed of twenty-five hens, also the extra labor involved in caring for the larger flock. How hens can be bred and cared for in such a way as to produce 150 eggs annually is well brought out by Prof. Gould of the Maine Experiment Station in a recent report. Starting ten years ago with an ordinary flock of Plymouth Rocks, the high producers have been selected from year to year by the trap nest method, these have been used as breeders in the year following the one in which they made a record. By this careful selecting it has been possible to build up a flock, the average of which is 160 eggs per hen. These hens were kept in the rigorous climate of New England. Yet many a man and some women would take these record-making birds and make scrubs of them by their methods of treatment. Having well-bred stock, it must be well cared for to continue heavy producers.

The method of developing and feeding these layers has been something as follows:

The chicks are hatched in incubators and brooded in colony brooding-houses. The houses are 7x12 feet, have a good tight floor, sheet roof and two windows and a door in the front. Two brooders are put in each house, separated by a partition. They are fed any food in the litter and dry mash is kept before them, given grit bone and charcoal and green food.

Here they are kept until the snow is off the ground, then this colony-house is moved to the field where the birds have a grass run until fall, when they are put in the laying-houses. In this house they are fed grain in the litter and dry mash in the hoppers. They have dry clover, beets, turnips, etc., for green food and are liberally supplied with meat in shape of beef scraps.

The record shows that it has cost $1.45 per hen for food as an average for several years, while the gross returns for eggs, has been something above $3.00.

Now, with a small flock, well cared for, anyone can do equally well; but when we have made twenty-five hens give us a record similar to the above, don't let us get ambitious to go into the poultry business and base estimates on what can be done with a small flock. If we do, we will stand a good show of being disappointed. As numbers increase, the attention to details is apt to be neglected, disease creeps in and causes loss. We fail to keep our birds up to high production, cost of keep does not diminish, and soon the balance is on the wrong side of the ledger. The profitable eggs of this country are to be produced by small flocks on the farms and village lots by those who do not make poultry raising their principal business, but rather a side issue for profit and recreation.—S. S. T.

WHAT TO FEED.

This depends on the locality. Make the basis of your mixture that grain or mill-product that can be most readily and cheaply obtained in your locality. If in the Middle West, corn. If in California, barley. In a locality where wheat is abundant and cheap, then use wheat. Study the composition of this substance selected and if deficient in protein add something rich in protein. If it runs low in fat, add to it foods rich in fat. If bran is readily and cheaply obtained, as compared with other food material, then make a goodly per cent. of the mash bran, but add to it something rich in starch and fat.

Barley is a starchy food. Corn contains a large proportion of starch and is also well supplied with fat. The addition of either of these to the bran tends to give us a better balanced ration. And a dollar's worth of this mixture will give us better results than a dollar's worth of either corn, bran or barley, fed alone. Try it.

The following makes a fairly well balanced mixture for California conditions:

Bran, 30 pounds; corn meal (feed meal,) 20 pounds; beef scrap, 5 pounds.—S. S. T.

POULTRY BREVITIES.

Keep the brooder the first week from 90 degs. to 95 degs.

* * *

To the temperature of the brooder may be traced much of the mortality among young chicks.

* * *

Ventilation without direct drafts is one of the essentials of a well constructed poultry house.

* * *

One great secret of getting a good profit from poultry is weeding out the unprofitable layers.

* * *

The trap nesting of fowls should be undertaken only by those who have abundant time to devote to it.

* * *

Most any of the standard makes of incubators will hatch a fair per cent. of the fertile eggs. It is when we come to raise them that the trouble commences.

* * *

Rhode Island Reds.

California Cultivator: Will you give us something of the origin and history of the Rhode Island Red fowl, now so popular with many? —E. M. K.

A writer in Farm Poultry gives the following information on the subject: The Rhode Island Red is a fowl that has been produced by several farmers in and about Little Compton, R. I. This community is largely engaged in the production of eggs for market. Rhode Island Red is the fowl kept by nearly all of them, but you occasionally see a few Light Brahmas and Barred Plymouth Rocks, and we are told that at one time you could see some R. C. Brown Leghorns. All these varieties and more have been used in making the Rhode Island Reds. Some Red Malays are said to be chiefly responsible for the color of this breed. Years ago these males were introduced and crossed on different birds

in this vicinity. The poultry farmers took a fancy to the red color, and always bred from red males. Whenever they introduced a cross they always saved the red males from this cross and bred them. In time the breed established had this red color, no matter whether the foreign blood introduced had been Light Brahma or Barred Plymouth Rock; but whatever it had been, the red always predominated, and these poultry raisers always clung to it. It should be borne in mind that this was years ago, twenty, thirty, or in some cases even fifty years ago. The introduction of the R. C. Brown Leghorn blood is said by many to be responsible for the rose comb variety. The fact that these farmers were not as particular in the selection of the females as they were in the selection of the males, is undoubtedly what has caused this breed not to breed as true as others until possibly very recently.

* * *

Blood Spots.

Will you please tell me, through your paper, why it is that fresh eggs have spots of blood in them?—C. E. Rice. Redlands.

Blood spots in eggs are due to slight hemorrhage in the ovaduct. When an organ is functionally very active, quantities of blood flow to that organ. In such cases small blood vessels may break and blood escape into the ovaduct. This is not a disease, but due to the marked activity of the organ. Such organs become readily inflamed by slight disturbances. Slight chill readily causes garget in the heavily milking cow, the congestion passing to inflammation.

Such conditions call for a cooling diet, as green food in abundance, less meat scraps and similar foods, and the addition of saltpeter to the drinking water; a teaspoonful to two quarts will be found beneficial.

* * *

Abnormal Appetite.

Please tell us why it is our chickens eat their droppings. Is it because they need some food we are not giving them? If so, kindly let us know what it is. They get all the grain they can eat, wheat, oats, barley and corn. Meat scraps, charcoal and cabbage are also given them.

Would appreciate some information on the undermentioned also. Some four weeks ago we got 200 B. Leghorn chicks from some man we know nothing about. The chicks, when we received them, looked nice, healthy little fellows, but since then they have steadily weakened and died. A white mucous, or matter, gathers in the eyes, and in some cases it is in such abundance that it just oozes out of the little beggars' eyes. In all cases it has proved fatal. They are fed on a good chick food and get beef scraps and green food.—"H. H.," Poultry Farm.

The cause of the abnormal appetites developed by animals at times is often hard to trace. In one case it may be lack of some ingredient in the food. In another, it may be from lack of exercise and occupation. I would suggest you feed more mineral matter and give the hens access to a supply of green food, that they can gather themselves, if possible, as a patch of alfalfa. The tincture of nux-vomica added to the drinking water, a teaspoonful to two quarts, will tend to tone up the digestive system. I think the Leghorn chicks contracted a cold either in shipping or at some other time, and it has developed to a catarrhal condition, resulting in the mortality that you mention.

* * *

Ticks.

Inclosed please find sample of ticks which we find in our hen-houses. Will you kindly tell us how to get rid of them?—A. J. H., Davis.

Spray the houses with kerosene emulsion, using a good spray pump. Do this after removing all rubbish. It would be well to add a pint of crude carbolic acid to two gallons of the emulsion, in which case you will have an excellent disinfectant as well. After thoroughly spraying, paint the under-side of the roosts and supports with crude oil.

Repeat this treatment in five or six days and think you will find the house free from not only ticks but mites as well.

WHITE AND BROWN EGG INCUBATION.

It is unnatural to incubate light and dark eggs together. Dark eggs are produced by different breeds from white ones and shell and membrane are of different texture. Place Leghorn and Cochin eggs in the same incubator and the Leghorns will hatch from 12 to 24 hours ahead of the Cochin and the Cochin chicks will never be so good as when kept in a separate batch. Have often tried, for convenience only to hatch Leghorn eggs with Brahmas, Plymouth Rocks, Wyandottes or Orpingtons and always the same result, whether under hens or with incubators—poor hatch from the browns and not up to average with the whites. Have had better results from mixed eggs by giving the browns twelve hours start of the whites.

WATER BASIN FOR CHICKS.

Take a basin that will hold about two quarts of water and fill it with pebbles a little smaller than eggs. When level full of the pebbles, pour in the water until the spaces between them are all full. Sink the basin in the ground until the rim is an inch above the surface. The chicks can run all over this, stepping on the pebbles and can drink the water without getting wet. We have used such a fountain for years with perfect success. It is easy to clean, keeps the water cool for several hours and protects the chicks from getting wet all over, as they cannot crowd each other into the water no matter how much they try to do so.—Minnesota and Dakota Farmer.

The night was dark, the coop was cold,
The rooster was infirm and old.
There was no flesh upon his bones;
His lice were cold as paving stones.

Deeply and darkly at dead of night,
No other bird around him,
Shanghai the slender gave up the fight
Dead the next morn they found him.

Black Minorcas

NORTH FAIR OAKS—ALTADENA CARS

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are laying fine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. ***Wm Starbuck & Son, Fullerton***

Trap-Nested White Wyandottes
That won 22 ribbons out of 25 and 6 Silver Cups and a carving set and a cut glass vase. All the National White Wyandotte Club Ribbons. Second on 10 pullet pen, contest open to all breeds. Mammoth Bronze Turkeys, winners of 5 blue ribbons, all at Los Angeles County Poultry Association Show, December 7, 1907. White Wyandottes were judged by H. Berrar of San Jose, Cal., and W. W. Browning of Ogden, Utah. Hens and Pullets, $15, $20 and up.

Bees and Their Care

WATER FOR BEES.

Few beekcepers are aware what amount of water is required by a colony of bees during the summer months, and how important it is that a permanent supply should be available within a reasonably short distance of an apiary, says a writer in the Agricultural Journal of Victoria. As a general rule, bees are left to themselves to get their supply of water wherever they can.

There is usually a natural watercourse, dam or water-hole somewhere in the neighborhood, and if permanent and withiu a few hundred yards of the apiary, such sources answer well enough. When, however, water is not permanently available within a quarter of a mile, it is greatly to the advantage of the apiarist to provide an artificial supply as near the apiary as convenient. I do not think that the time occupied by the bees in carrying water over a longer distance need be seriously considered, but the greater liability of being caught by birds and insects blown down during strong winds or caught in rain-squalls during the longer journey is a serious matter. At the margins of dams and water-holes hundreds of bees are often destroyed within a few minutes by cattle or horses stamping them into the mud or swamping them through the plunging of the auimals into the water.

Saves Hard Feeling.

Where many bees are kept, and the water supply is limited, they become a uuisance to stock, aud sometimes a source of ill-feeling between neighbors in consequence. Bees are also very annoying about the apiarist's own home, round water-taps, tanks and the drinking dishes of poultry, when the weather is hot, and any other supply of water rather far from the apiary. The writer was confronted with all the troubles enumerated when first establishiug his apiary in its present location; an automatic artificial supply close to the apiary has overcome these difficulties, and has now been working contiuuously for eight years without a hitch.

The water is obtained from the roof of the honey house and stored in two tanks of 1000 gallous each. An iron water pipe, laid underground (18 inches deep) so as to keep it cool in summer, conducts the water to the drinking troughs, which are at a distance of about 100 feet from the building, and the same distance from the nearest hives. This distance is necessary, otherwise the bees, when flying to and from the water, interfere with work in the apiary, and also cause confusion at swarming time. There are two drinking troughs; they are placed on a stand at a height of three feet from the ground, in order to prevent poultry going to them, and to keep drifting leaves and other material out as much as possible.

Each trough measures 36 inches x 24 inches inside, with a depth of six inches, and consists of a frame made of 6x7-8 white Baltic flooring boards, with a bottom of 6x½ lining boards. It is lined with plain galvanized Iron, No. 26 gauge, neatly fitted inside the wooden casing, to which it is secured at the top with fine tacks. It is better to have two or even three of such troughs instead of a large one of the same surface area as the two or three combined. If only one large trough is used the bees are too much concentrated, and a good deal of fighting and stinging takes place occasionally. It is, therefore, better to have several troughs a little distance apart, and if they are placed on the same level and connected by means of a piece of garden hose attached to a stud at the bottom of each, one stand pipe, with automatic tap, will supply them all. On the top of each trough floats a raft, upou which the bees alight to drink, aud it Is so constructed that they cannot drown, and even dead bees cannot drop into the water and thus pollute it. The raft is made of slats of ½-inch lining boards, 35⅝ inches long, 15-16th iuch wide, and ½ inch thick. The edges on the upper side are planed away at an angle of 45 degrees, so that when the slats are placed side by side they form V-shaped gutters, with an openiug 1-16 inch wide at the bottom. Twenty-four of these slats are nailed on to three cross-pieces of ⅞-inch flooring board 23½ inches long and 2 inches wide, in such a way that the thin bottom edges of the slats are 1-15 inch apart. The raft is then fitted into the trough and dressed till a space of not more than ⅛ inch remains all around between the raft and the lining of the trough. An automatic valve can be arranged to keep the water at a uniform level.

RIVERSIDE PARK.

MANUFACTURED HONEY.

Frank M. Benton of the United States Department of Agriculture is another who does not believe there is such a product as manufactured comb honey. He says: "I am aware that there is a popular belief in the idea that much of the comb honey sold in the open market is manufactured and adulterated; that is, prepared artificially in factories. Such is not, however, the case, as an examination of the whole subject would convince any fair-minded person. Were this so, it would be very easy to select two sections of the same make which would be exactly alike, being produced by machinery, but no two sections of honey have ever yet been seen that were exactly alike.

"There exists stil another reason which may be brought up as a strong argument against this popular fallacy. The cheapest manner in which any substance cau be placed in honey combs, sealed over and put on the market so as to sell readily for comb honey, is to employ honey bees and place them in a rich field where honey-producing plants are abundant. Aside froui the difficulty of producing combs themselves, every pound of liquid prepared or placed in these combs would cost the adulterator several cents at wholesale rates, then would follow the labor of sealing. The whole thing would require expensive machinery and the employment of workmen in order to do the work were it possible, on any scale, commensurate with the idea of profit. It is much simpler, and far less capital is required, to set up apairies and allow them to increase, as they naturally do, and gather supplies from the boundless realm of nature, where the cost is nothing."—Journal of Agriculture.

DANGER IN OLD BEE HIVES.

I will endeavor to explain my experience in using old hives in which some one's bees died, and not knowing what was the cause of the bees dying.

In 1905, during the swarming season, I ran short of hives, so I used some of the hives that belonged to the fellow who had formerly kept bees where I am keeping mine. At one time he had some one hundred colonies, but lost them all in a short time. He said his bees died from neglect and moth worms. So I thought if the moths were the cause there would be no use in burning out the hives to prevent foul brood. This summer I have had three or four cases of foul brood, which started in these old hives. This goes to show that his bees died from foul brood. Now, my using those old hives may cause me to lose all my bees.

I will say to any one, if you are going to use hives that the bees have died in, unless you know for certain that they did not die from diseases, I would advise you to burn out the insides of the hives thoroughly and everything that goes with them. Ex.

BEEKEEPING ON A SMALL SCALE.

If one keeps bees on a small scale it pays to have the best of hives. They cost something, but they last well, aud your bees do better, winter better and make more honey generally than if you put them in any old box. The bees feed themselves, so there is no feed to buy, as in the case of chickens, and of course they will increase some, which increase you can generally dispose of, if your terms are not too high. There is nothing about the bee business that we know of that a woman cannot master as well as a man, if she care to .

The vetches are not honey plants of the first order, but they do furnish a large amount of honey-bearing nectar in their flowers and stipules; they make a good growth and constitute withal a very valuable forage legume.

DIVIDEND NOTICE.

San Francisco Savings Union. N. W. Cor. California and Montgomery streets.

For the half year ending June 30th, 1908, a dividend has been declared at the rates per annum of four and one-quarter (4¼) per cent on term deposits and four (4) per cent on ordinary deposits, free of taxes, payable on and after Wednesday, July 1st, 1908.

Depositors are entitled to draw their dividends at any time during the succeeding half year. A dividend not drawn will be added to the deposit account, become a part thereof and earn dividend from July 1st.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The Savings and Loan Society. 101 Montgomery St., Corner Sutter St., San Francisco.

For the half year ending June 30, 1908, a dividend has been declared at the rate of 4 per cent per annum on all deposits, free of taxes, payable on and after Wednesday, July 1, 1908. Dividends not called for are added to and bear the same rate of interest as the principal from July 1, 1908.

WM. A. BOSTON, Cashier.

THE HARD PART.

"Take the stand," said the court to the railway magnate.

"Thank you, judge," replied the person addressed. "Would you mind sending the bailiff out for a screwdriver. The thing seems to be fastened down."—Philadelphia Ledger.

What you bring away from your field in straw and grain depends largely on what you carry to it in cultivation.

General Agriculture

THE VALUE OF A LOAD OF MANURE.

A LOAD of fresh manure (1 ton) contains ten pounds of nitrogen, two pounds of phosphorus and ten pounds of potassium, besides other elements of plant food not so important in point of provision. If figured at commercial prices, the nitrogen at 15 cents a pound, the phosphorus at 12 cents and the potassium at 6 cents a ton of such manure would be worth $2.34.

But bare figures are not interesting unless their relations to other things which do interest us are shown. Corn fodder, for instance, has 16 pounds of nitrogen, 2 pounds of phosphorus and 17 pounds of potassium. It is worth, merely as manure when figured as above stated, $3.65.

A ton of oat straw is on the same basis worth $3.25. Wheat straw is worth $2.75; clover hay $8.40; alfalfa hay $9.40; cowpea hay $9; timothy hay $5.35. Thus a ton of manure would be less valuable than a ton of any of our ordinary field crops, if the latter were used as fertilizer only, and also supposing them to be immediately available as plant food. The fact that they require a longer or shorter period for decay, while manure is quickly available, accounts for the more apparent value of the manure.

It is interesting also to note that a ton of manure contains sufficient nitrogen for 10 bushels of corn; enough phosphorus for 11 3-4 bushels; enough potassium for 52 3-5 bushels. For wheat there is enough nitrogen for eight bushels; phosphorus for 13 1-2 bushels; potassium for 36 1-3 bushels.

Now let us compare a ton of manure with an equal quantity of commercial fertilizer. We shall take such fertilizers as are best for some one element, rather than mixed or complete fertilizer, because the manufacturers charge extra for the mixing. A ton of sodium nitrate has enough nitrogen for 310 bushels of corn or 270 bushels of wheat; it costs $46.50. A ton of bone meal contains enough phosphorus for 1470 bushels of corn or 1666 2-3 bushels of wheat; it costs $30. A ton of potassium chloride (sometimes called muriate of potash) contains enough potassium for 4200 bushels of corn, or 3055 bushels of wheat. Accordingly, if one ton of sodium nitrate, one-third ton of bone meal and one-fourteenth ton of potassium chloride be applied to one acre, capable of producing say 50 bushels of corn, six 50-bushel crops might be taken from it and the soil still be as fertile as before. The cost of fertilizer would be nearly $60. The crops at 35 cents per bushel would amount to $105. An equal quantity of manure would not produce one such crop of itstelf; yet at commercial fertilizer price $60 would purchase 25 tons of manure, which would produce five 50-bushel crops without drawing upon the soil at all.

The value of manure is not limited to plant food alone as are most commercial fertilizers. Manure has the effect of making the soil looser and more easily tillable. It gives better color and enables the soil to drain better and retain moisture better. Also sets free other foods from the soil. Commercial fertilizers require that other things, such as straw or green manures be added to prevent the land from becoming "killed," as the condition is often termed.

It must not be inferred from this article that commercial fertilizers are more valuable than manure. Manure does not cost the farmer $2.34 per ton even where he hires a hand and hauls it several miles from town or city. What we wish to show is that the farmer can afford to pay that much before he needs to think about investing in commercial fertilizers.—Missouri College Farm.

NOW'S THE TIME!

Time for what?

Why for the people to do some thinking about what kind of a postal service they want.

Platforms—political platforms for congressmen to stand on—need framing.

In whose interest do you want them framed, my dear fellow citizens? In yours? Or in the express companies and corporations generally?

Whoever you are, whatever you are, merchant, mechanic or farmer, do you think it really benefits you to pay treble the real cost for the transportation of foods you need?

Do you know that while you can send by mail one pound of merchandise to London, England, for 12 cents, you are made to pay 16 cents for the same pound if you mail it to the next village in California? Is this in your interest? You have been told it is! Do you really believe it?

Do you know that the express companies carry for the British Post Office parcels up to 11 pounds weight from New York to any point in the United States for 24 cents each?

Do you know how much they charge you for the same service?

If not, just enquire of Wells Fargo & Co.'s agent. Do you want this to continue?

Don't talk what the express companies have put into some gullible merchant's mouth, that an up-to-date parcels post will ruin local trade by throwing business to the mail order houses.

Don't you know that lots of these houses already send their wares free of all charge for transport to their customers? Probably special rates favor this. Why not let your post office handle your parcels with equal rates to all, and with surety of no secret rebates or favors to any? Cheaper transportation helps and makes trade; does not hurt it.

If you want cheap parcels post see you have your delegate to your party convention instructed to put it and keep it in the party platform.

And Now's the Time!—Edward Berwick, Pacific Grove.

Those contemplating the culture of alfalfa should use every available means of familiarizing themselves with its necessities and the aids to its growth. As shown by Bulletin No. 300 of the Station at Geneva, New York, inoculation with nitrogen-gathering bacteria is necessary to success on a great majority of fields where alfalfa has not previously grown. Without inoculation the chances are four or five to one against success, while with it, 70 per cent of the fields under test gave satisfactory yields. The use of soil from an established successful field has given better results than any other method of inoculation tested. All bulletins of the Station are sent free to applicants.

Malthoid Roofing

Saved the lumber, coal and building plant of A. I. Schowalter & Co., of Halstead, Kan., from fire last March. The south wind blew the flames from a barn filled with hay directly on the sheds of this company. These sheds were roofed with Malthoid, while the sides were covered with corrugated iron. The heat was so intense that it ignited the wood back of the corrugated iron and it was only with difficulty extinguished. The fire-resisting qualities of Malthoid Roofing saved the roof, which was subjected to the most heat.

Malthoid Roofing is fire-resisting and durable.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Spray for Spider.

I send a few apple leaves that seem to be infested with a plant louse that is on my cabbage plants.

You will also notice some of the leaves are curled, with a small worm on the inside. These leaves were taken from my orchard planted last December. Will Bordeaux mixture kill them?—W. B. W., Santa Cruz.

The Bordeaux spray is of no value for insects. It is for killing fungous growths only. Spray with tobacco solution or distillate emulsion. See issue of Cultivator of March 12, for fuller directions.

Brown Scale.

The specimens of scale infesting the leaves of the orange from your correspondent at Lodi prove to be the soft brown scale, Coccus hesperidum. It can be best controlled in this particular case by kerosene emulsion, which is made as follows:

Dissolve one-quarter pound of yellow soap in a gallon of hot water. Add a gallon of kerosene and mix the two thoroughly, this being best done by pumping the solution back into itself with a pump.

This is a stock solution and should be diluted to twenty-five or thirty gallons. This preparation should be made in these proportions, and of course, can be made in any quantity.—H. J. Quayle.

Mold on Grape Juice.

An inquirer wishes to know reason for mold forming on surface of bottled grape juice. The inquiry was referred to Mrs. Louise Cary Smith of Pomona, who has for years put up perfect juice. At least it is nearly enough to perfection that she won gold medal over all producers at Portland Exposition and has built up a business which is attracting the best trade of the country to her "El Verde" brand. Mrs. Smith guarantees her product to be grape juice—absolutely no preservative other than sterilization. We may add, however, that the painstaking work of Mrs. Smith and the absolutely cleanly method of work and attention to details, from washing the grapes to final bottling, which she personally supervises would permit no spores of mold to infect her product.

Mrs. Smith says:

"Concerning the cause and preventive of mould forming on grape juice, I would say the cause is largely due to the use of moldy grapes in crushing, and the prevention can only be secured through the utmost care in sterilizing or "pasteuring." For fuller details of this process, I beg to refer your subscriber to a bulletin on "The Preservation of Unfermented Grape Must," issued from our State University several years ago."

Raising Rabbits.

Several questions have been sent in regarding care of rabbits and Belgian hares. We recently requested Mrs. Bee Josephine O'Mealey of Kanova Ranch, Anderson, to give some information. She is qualified from years of experience. She writes:

People do keep all ages, sexes and conditions of hares in one pen, but so do certain of our foreign element live—twenty or more in one single small room; and one condition is just about as advisable as the other. We never find it safe to keep two or more animals, male or female, in the same pen after breeding once. Does may be kept together until bred or bucks until service is permitted, but not with safety afterward. One has a very different opinion of the "timid hare" after seeing the incredibly vicious fight a pair of does will put up. No quarter is given and the fight is to the death, unless separated.

It is sometimes necessary to give one doe some of another's progeny to rear. In such case the interloper should be as nearly as possible the same size as the foster mother's own little ones—smaller in preference to larger. Before being introduced to the nest the strangers should be rubbed or wiped over with some of bedding material which is saturated with the excretion of the intended mother. Unless this be done to remove the scent of the dam, the foster-mother will invariably destroy it. I have seen a cat bring up young hares with excellent results, but personally consider a cat-mother too much trouble.

People sometimes become unduly alarmed and think a doe neglects her little ones because she is not seen to nurse them. In years of experience with large numbers of hares I have never seen but one doe nurse her young.

Hares demand clean quarters, wholesome feed, fresh clean water twice a day, and freedom from interference.

Powdery Mildew.

Please tell me what is on the enclosed apple leaf.—Subscriber, Gardena.

The apple leaf sent by your subscriber at Gardena is affected by the powdery mildew, a very common trouble with apples in this State. This disease is best controlled by spraying with some kind of a sulphur mixture early in the season before it has developed. For this purpose we have used a solution of sulphide of potash of about one ounce in two gallons of water. A lime sulphur mixture is also effective, and the so-called Rex spray, a compound, and the so-called being used to a considerable extent at present for this purpose. I also find included a twig of peach leaves from San Diego county. These appear to have been affected by some insect, and I will keep them for Professor Quayle. Ralph E. Smith.

Red Spider.

What is best method of destroying red spider? Where can I get government bulletin on the subject?

H. S., Orange.

See Cultivator of March 12 for sulphide formula or blow dry sulphur through the tree. This should be done before the pest appears, to be most effective. Write Experiment Station, State University, Berkeley, Cal., for bulletin, or Department of Agriculture, Washington, D. C.

Dipping Fumigating Tents.

Will you tell me regarding dipping of fumigating tents to preserve and make them more effective in holding gas? S. W. M., Orange.

Commissioner Pease of San Bernardino gives the following:

We have a tank over a furnace large enough to hold a 45-foot tent easily. Over this we erect a derrick high enough to raise the tents out of the tank after they have been dipped. The tank is filled two-thirds full of water and to this is added enough oak extract to make the tents a good color. We use nearly half a barrel at first and add more extract as we need to fill up the tank. The tents are immersed in this when boiling and kept boiling until the tents are saturated all through.

The tents are then pulled up out of the tank by means of the derrick and after draining a few moments are spread out on the ground to dry, after which they are rolled up and stored until needed for use.

The oak extract is used as a tanning process to prevent mildew, and to fill the cloth. The only place that I have been able to find oak extract in Los Angeles is at F. W. Braun Drug Co. Larger tents can be dipped one-half at a time, dipping one-half and then reversing the tent and dipping the other half. S. A. Pease, San Bernardino.

Dodder.

The enclosed growth is continually forming on my alfalfa and killing it.—Subscriber, San Diego.

It is "dodder" or love vine, a yellow, leafless, thread-like vine, which is an annual. Cut off the infested spot and burn straw over it. Never let go to seed as it will continue to perpetuate itself. In buying alfalfa seed always insist it be free from dodder seed.

Aphis.

I am sending you a lima bean plant, under separate cover, which I took from a field yesterday evening. There are a great many affected the same as this and most all of the bean fields hereabouts are affected more or less. Can you let me know a spray or anything else that will stop their spreading? Please answer through the Cultivator.—A Subscriber, Carpenteria.

Aphis, and an exceedingly bad case of it. Kerosene emulsion will readily kill the pest, but must be used quickly. It is probable a change in weather will give you relief.

Output of Potatoes.

A reader recently required the output of potatoes for the coming year. The query was referred to the State Board of Trade at San Francisco and it replies:

It is an impossibility at this season of the year to make even an estimate as to the output of the potato crop for the State. In many localities not all of the early crop has been dug and the late crop has not come in yet. When we are in position to give you the information even approximately correct we will be glad to do so.

Red Gum.

W. A. Burnell, a subscriber to the Cultivator, who recently moved from Los Angeles to Imperial county, writes a glowing report of his new home near Calexico, saying: "It was quite a risk but I am glad I took the chance. I planted last week five acres to Egyptian corn and in four days it was out of the ground and on the evening of the fifth it was one inch above the ground and had a root three inches long. It will give me fodder for stock in six weeks. The heat has not been as bad as I expected, and the worst I have experienced was 112 degrees; have worked out in the sun every day since I came. There is about fifteen degrees difference in the way the heat feels, and I am told that 100 degrees here is about the same as 85 in Los Angeles. What varieties of the eucalyptus are best adapted to the Imperial valley?"

Try the Rostrata or ordinary red gum.

A HUMAN FAILING.

"Pa, what is the meaning of inconsistency?" asked Freddy.

"Inconsistency, my son," explained pa, "means a man who growls all day and then goes home and kicks the dog for barking at night."—Harper's Weekly.

Warranted to give satisfaction.

Irrigation and Forestry

FOREST FIRES.

The attention of all persons who inhabit or frequent the forest or brush-covered areas of California is called to the following provisions of the State Forest Laws relating to forest fires.

Under Statutes 1907, Chapter 536, it is a misdemeanor, punishable by a fine of not less than $25 nor more than $500, or imprisonment not less than fifteen days nor more than six months, or both, to commit any of the following acts:

1. To set fire on the lands of another, except camp fires, which may be built on unenclosed lands if the owner has not forbidden it in any way, and provided the builder totally extinguishes the fire before leaving it.

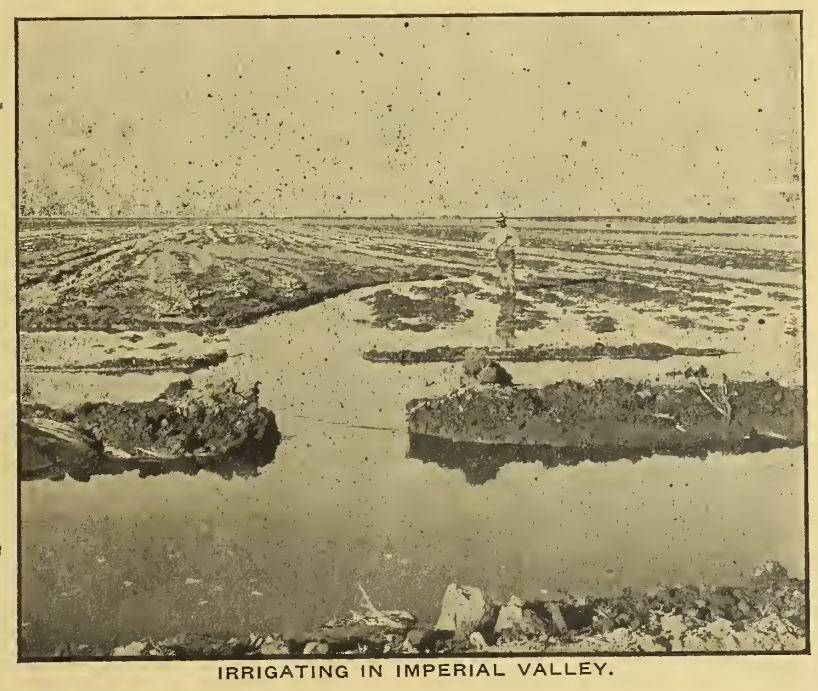
2. To allow fires, lawfully set, to escape from the control of the person having charge thereof, or to spread to the lands of another.

3. To build a fire anywhere (except camp fires and fires set to facilitate redwood logging) without first securing written permission from a State Fire Warden.

4. To use any engine or boiler, burning fuel other than oil, unless the engine or boiler is equipped with adequate devices to prevent the escape of fire from any part.

5. To refuse to obey the summons of any State Fire Warden to fight fire. (For this the fine is not less than $10.)

The light rainfall of last winter and the long spring drought makes the danger of fire this summer particularly great. On that account every precaution to guard against it should be taken. Your co-operation is sought to this end. If you have evidence that the State Forest Laws have been violated, place it in the hands of your District Attorney at once, and notify me. All violations will be prosecuted whenever sufficient evidence to secure a conviction can be gathered.—G. B. Lull, State Forester.



IRRIGATING IN IMPERIAL VALLEY.

IRRIGATION.

The Evening Index really ought to read up on the history of Southern California, and this county in particular. Such a course in reading would save its making so many ridiculous mistakes. For instance: In its editorial of last Friday it says of Mr. Matthew Gage, builder of the Gage canal, now irrigating in Riverside county some thousands of acres:

Gage is the pioneer irrigationist of Southern California. It was he who planned and built the first great irrigation system in Southern California, by which the country about Riverside was turned from a desert into fertility by water carried a dozen miles from the San Bernardino valley.

It is to laugh! Mr. Gage is not the "pioneer irrigationist of Southern California." He did not plan and build the first great irrigation enterprise in Southern California. At the time the Gage canal was built Riverside was not a desert, but had planted, growing and flourishing thousands of acres of trees, vines and other vegetation.

But Riverside was not the first irrigation enterprise in South California by nearly three-quarters of a century. Sometime about 1770 or 1771, the old Mission Fathers at the mission in San Diego, led the waters of the San Diego river out on the valley lands for the purpose of irrigating the same. About 1778 the Mission San Gabriel was irrigated from the waters of the San Gabriel river, and the old aqueducts or fragmentary remains thereof, remained sound and solid until only a few years ago. In this valley the branch mission of San Gabriel, in the western part of Redlands, was established and the zanja which now runs through the city, was built for irrigation purposes, and this same zanja has been in use continuously ever since, more than a hundred years. In fact, this zanja is the oldest irrigation system in the United States in continuous use.
—Redlands Citrograph.

Secretary Fischer of the State Agricultural Society visited the fruit growers of Sacramento valley and urged extensive exhibits at the coming fair.

THE FLEET IN CALIFORNIA.

Out there in California
They are pawing up the soil,
They are letting go of business
And neglecting of their toil;
They're forgetting their religion
In the house and on the street,
And likewise, too, their politics—
They're dotty on the fleet.

They are loading up the jackies
With a cargo of pink teas,
They are crowding them with welcome
As the heroes of the seas;
They've taken off the lid of things
And made the whole coast free
For every tarry visitor
Who came to them by sea.

They have set the valiant officers
On pinnacles of fame,
They've filled their veins with native blood
Which gets there just the same;
They have given them the climate
In its glory and its bloom,
With an affidavit showing
It will drive away all gloom.

They swim out in the briny deep
By either day or night
To meet the coming warships
Before they get in sight;
They flock around the anchored steel
Like fish around the bait,
And shout their joy along the coast
Up to the Golden Gate.

Oh, say
Out California way
When they do things
They do 'em on wings.
It's the boast
Of the coast
That nowhere else on earth is found
The California greet.
And now they're handing out their best—
They're dotty on the fleet.

L'ENVOI.

And Roosevelt, as the fleet makes good,
Smiles some, but goes on sawing wood.

—W. J. Lampton, in the New York World.

IN CAMP.

TEDDY disconsolately munched a soda cracker, wondering the while how she had ever come to insist that a camp stove was a useless luxury.

It was her first season in camp, and her brothers had readily enough given in to her demand for an absolutely correct atmosphere. They had camped in tents on the little lake instead of in the comfortable wooden shack on Lower Lake, and they had cooked in primitive fashion over an open fire.

The boys had done the cooking since they had gone into camp three weeks before, but it had all seemed so easy that when they wanted to go down the lake to the village, she had insisted that it would be no trouble at all to get her meals.

They had paddled away just as the sun began to tinge the clouds in the east, and would not be back before night. Twice Teddy had spilled the bacon into the fire, and as a crowning accident she had set the coffee pot wrong, and that, too, was sliding into the flames, putting out what little fire there was left.

A crashing in the underbrush roused her and she sprang to her feet, nervously handling the revolver the boys had left with her for protection. She raised the glistening weapon as a man burst through the tangle of brush, and with a voice that she tried to make stern, commanded him to hold up his hands.

They went above his head in an instant, and staid there while he paralleled. Teddy knew that the next thing was to bind her victim, but how to do that and retain the revolver was something that was not told in books.

He smiled at her look of helplessness and came a few steps forward.

"I am not a tramp or a robber," he said, with a flash of white teeth beneath his mustache. "I saw a fire awhile back and thought that perhaps I might beg some breakfast. I wandered further from our camp than I intended. I am on the other side of the ridge on Blue lake"

"There isn't any breakfast," she said, forlornly. "I spilled the bacon into the fire, and then the coffee pot fell in. I was eating these." She waved her revolver toward the box of crackers, and the tramp smiled.

"If you will take my parole," he suggested, "I'll earn my breakfast. I believe that is the proper thing for a tramp to do."

Teddy lowered her gun. He probably was a tramp, but he had nice eyes and a pleasant smile, and she felt that she could trust him.

"If you will set the table," he called, "I'll have things ready in a jiffy."

For a moment Teddy paused. She did not quite like the idea of eating at the same table with a tramp. None of the campers she knew wore such outrageous garments.

But the smell of the coffee and the frying fish decided her, so she set two plates.

Skillfully he dished up the fish and took the coffee from the fire. He was even more expert than the boys. Probably that was because he had to camp out the year around.

The breakfast put her in an excellent humor, and when the tramp suggested that if she would lend him a gun he would try and get something for dinner, she loaned him a shotgun without a thought until he had left the camp.

Then the realization of what Bob would say should he come home and find the gun gone led her to follow the trail the tramp had taken.

She soon overtook him, and he looked up with a smile at her approach.

"Come to share the fun?" he asked pleasantly. Her blush told its own story, and he threw his head back and laughed. "I was going to bring the gun back," he declared. "Do you really think I am a tramp?"

"No," her voice lacked conviction. "But, you see, you are not like the boys.'

"Possibly they would be like me," he suggested, "if they were in camp without ladies. Khaki and leggins are all very pretty, but there is more comfort in an old suit that won't be hurt if you do take a notion to wade a trout stream before breakfast."

After dinner he entertained her with stories of the woods, and neither realized how late it had grown until a boat shot around the point, and the boys waved a welcome.

They swarmed up the beach a few moments later, and Teddy started as they warmly greeted the tramp.

"I didn't know that you knew Mr. Charteris," said Bob in surprise.

"He came for breakfast," explained Teddy.

"And having had the breakfast, I stayed to get the dinner," Charteris added with a laugh. "You see I was out early this morning, and got too far away from camp to make it for breakfast. Then I saw this fire and came over."

"Hope you'll come over often," said Bob heartily. He liked the young railroad magnate.

"Thank you," said Charteris, seeing a second invitation in Teddy's brown eyes. "I think I shall be over very often—if Miss Trevor does not mind such trampish fellows hanging about the camp."

"I rather like tramps," said Teddy demurely, "especially before breakfast."

—San Jose Mercury.

WASTEFUL.

The trite saying that the ordinary American family throws away food enough to keep three French families in comfort is a little exaggerated, but it comes fairly close to the mark. We are guilty not only of that crude method of waste which consists in throwing away good food, but also probably more still is lost by our ignorance of cookery. Some American men know how to cook, but few of our women. This beautiful and beneficient art is either below or above their faculty of comprehension. A high-priced steak after the maltreatment it receives in the ordinary American kitchen is a pathetic spectacle. There is no need of considering what happens to cheap steaks for we never buy them. Nothing is good enough for us but the cuts which cost the most. Those other parts of the steer which in a French kitchen become delicious soups, ragouts, stews and patties we throw to the dogs. Generally speaking, the American citizen knows nothing about soups.

We have a theory in this country that it is dangerous to be economical of food, rent and clothing. We are taught by certain great philosophers that any saving we might effect in these particulars would accrue presently to our bosses and not to ourselves. The transfer would be effected by a cut in wages. Wages, these eminent sages teach, keep evermore at the exact level of the standard of living. Lower the standard of living by eating round steak instead of porterhouse and down in the same measure goes the level of wages. Is there anything in it?

At any rate it is by this theory that we excuse our National extravagance to ourselves. In doing so we forget that a determined habit of saving such as prevails in France would soon transform our workman into capitalists and then the level of wages would no longer concern them.

HOMELY HINTS.

When you have been poisoned by ivy, or, in fact, any plants or vines, bathe the parts in clear hot water—have it as hot as possible. Dry the affected parts with a soft cloth and bathe with tincture of lobelia. This should be done twice a day. Where skin is broken, be very careful about using the lobelia in this way, as it is very painful when it comes in contact with the raw flesh.

To keep flies from roosting on the screen door, ready to come in when it is opened, take a piece of an old window shade, or else fold a piece of manilla paper as long as the door is wide and about half a yard wide, and cut into narrow strips to within two inches of the top, then tack across the top of the door. The gentlest breeze or the movement of the door, when opened will keep the flies away.

CURFEW.

Solemnly, mournfully,
Dealing its dole,
The curfew bell
Is beginning to toll.

Cover the embers,
And put out the light;
Toil comes with the morning,
And rest with the night.

Dark grow the windows,
And quenched is the fire,
Sound fades into silence,
All footsteps retire.

A FEW DEFINITIONS.

Many children are so crammed with everything that they really know nothing.

In proof of this read these veritable specimens of definitions written by public school children:

"Stability is taking care of a stable."

"A mosquito is a child of black and white parents."

"Monastery is the place for monsters."

"Tocsin is something to do with getting drunk."

"Expostulation is to have the smallpox."

"Cannibal is two brothers who killed each other in the Bible."

"Anatomy is the human body, which consists of three parts, the head, the chist and the stummick. The head contains the eyes and brains, if any. The chist contains the lungs and a piece of the liver. The stummick is devoted to the bowels, of which there are five, a, e, i, o, u, and sometimes w and y."—Literary Digest.

ONE KIND OF GIRL TO SHUN.

No matter how attractive a girl may be in face and figure, if she is thoroughly selfish all prudent people will shun her. No careful person is likely to be charmed with the girl.

Who never thinks of anyone but herself.

Who never makes an effort to oblige others and yet expects to be waited on hand and foot herself.

Who never will own that another girl is pretty, but who endeavors instead to find some defect in her to point out to others.

Who never does a stroke of housework, but selfishly indulges in gaiety and amusements while her mother slaves to keep affairs in order.

Who never is happy unless she is monopolizing the conversation and the interest of the men in the room.

Who never takes any notice of children, but considers them "little nuisances." "plagues," who ought never to have left the nursery.

Who never confesses she is in the wrong, but sticks to her point through everything.

Who spends all her money on dress, sweets or some luxury for herself.

Who never bestows a kind word on those beneath her in position.

Who never, above all, could love or seriously consider the comfort of any other person but herself.

THEIR REAL WORTH.

One day as a leading lawyer and a judge, both of Boston, were walking together the lawyer said:

"Judge let's go into partnership. You furnish the money and I'll furnish the brains."

The judge quickly pulled out a two-cent piece from his pocket, and holding it in the palm of his hand said to the lawyer: "Very well, old chap, cover that."

In India cakes of tea pass as money.

DOUBLY USEFUL MUCILAGE.

"If you make your own mucilage (one heaping teaspoonful of gum arabic to an ordinary mucilage bottle gives it pure at a cheaper rate than that bought ready made,) you can dispense with court plasters, liquid or otherwise, except where an antiseptic is necessary," says Woman's Home Companion for July. "Ordinary cuts can be coated with this quite as effectively as with the patent preparation. Two coats thoroughly dried will stand the application of water better than anything but the adhesive plaster doctors use—an inconvenient, expensive luxury."

MAGIC POLISHING CLOTHS.

Mix two pounds of whiting and one half ounce of oleic acid with a gallon of gasoline. Stir and mix thoroughly. In this compound soak flannel rags of the desired size, then wring out and hang up to dry, being careful to keep them away from a fire or open flame. These cloths will give a fine gloss to silverware, will not soil the hands. and will preserve their polishing qualities indefinitely.—Woman's Home Companion.

TO CLEAN FABRICS.

Grate two large sized potatoes into a pint of water, then strain same through a coarse sieve into another vessel containing a pint of clear water. Let this stand until thoroughly settled. The clear solution is poured off and used to sponge fine materials, which are afterward washed with clean water, dried and ironed.

WORTH HEEDING.

Begin it right.

Get the right habit.

Imitation indicates limitations.

Laziness is next to uselessness.

Thoughts are the best character builders.

The man who is too smooth often becomes slippery.

A good front doesn't last long without a good backing.

The Lord hates a coward, and abominates a dodger.

A man's future is more clearly indicated by his past than by his palm.

It is a good thing to be sure, but don't be too sure you are sure unless you're mighty sure.—Silent Partner.

Tommy was stubborn and his teacher was having a hard time explaining a small point in the geography lesson.

"Tommy," teacher began, "you can learn this if you make up your mind. It's not one bit smart to appear dull. I know," she continued, coaxingly, "that you are just as bright as any boy in the class. Remember, Tommy, where there's a will there's——"

"Aw," broke in Tommy, "I know all dat, I do. Me fadder's a lawyer, he is, an' I've heard him say it lots o' times."

"You should not have interrupted me," reprimanded the teacher, "but I am glad that your father has taught you the old adage. Can you repeat it to me?"

"Sure," said Tommy confidently. "Me fadder says dat where der's a will —der's always a bunch o' poor relations."

For those who fit buttered papers in their cake tins it is a good plan to leave small projections of the paper on two opposite sides which can be used as handles in removing the cake.

There's now and then a one-horse farm of another color.

The Produce Markets

Los Angeles Markets

LOS ANGELES, July 8, 1908.

The whole produce market has been in a more demoralized condition than in months. Cantaloupes especially have gone to the bad, and all fruits have been in such large supply that the market has been continually glutted. Potatoes, onions and most vegetables, likewise have been rather weak.

Butter.

The predicted slump in butter occured and a 2½ cent drop was made Saturday. At present quotations the market is fairly firm. The receipts are very heavy, some days as high as 27,000 or 28,000 pounds.

Wholesale quotations now are:

Creamery ex per roll..........50
Firsts..........47½
Dairy..........25
Cooking..........25
"Butterine"..........15@20

Cheese.

Southern California..........15
Northern fresh..........13½@14
Longhorn..........17
Eastern singles..........15½
Cheddars..........17
Imported Swiss..........28@30
Swiss..........17½
Oregon..........15
Limburger..........17½

Eggs and Poultry.

Eggs have advanced slightly, but the market is not strong. It has been deemed wise not to advance further.

The wholesale trade are asking:

Eggs local candled..........23
Eggs case count..........21¼@21½
Firsts fresh..........22
Eastern fresh..........21

Wholesale prices..

Hens per lb..........10@12
Young roosters per lb..........17
Fryers..........17@20
Broilers per lb..........15@18
Roasters..........16
Old Roosters..........7
Turkeys..........16@18
Geese..........11@13
Ducks..........10@12
Squabs.......... 1.50@1.75

Live Stock.

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs from 175 to 200 pounds..6¼ @6½

Hay.

Somers & Co. say:

Arrivals of hay continue to steadily increase, the total for the week ending today amounting to 4290 tons in comparison with 3860 last week and 3150 for the week preceding that. With the increase in shipments the market continues to weaken until at the present writing conditions are badly demoralized here and hay selling in San Francisco for even less than buyers have paid for same in the country. This condition cannot, of course, continue so one of two things must result—shipments to market must be materially lessened or the selling price in the country reduced. As large quantities of hay are ready for shipment at many points we incline to the idea that it is the selling price in the country that must show change, for conditions in no way warrant the prices that are being very generally asked throughout the interior. Business along all lines has become very dull and the hay market is always materially affected by such conditions, for the consumption of hay here is materially reduced when general business operations become dull.

The future presents nothing of promise or of interest, and it is generally conceded that for the next six months we must expect very quiet times throughout the Pacific Coast.

The market for new crop hay is becoming more firmly established along definite lines, although the tendency is decidedly downward. We give present prices as follows:

Choice wheat hay..........15.00@16.00
Good wheat hay..........13.00@14.50
Other grades same..........11.00@12.50
Wheat and oat..........11.00@14.00

SCIENCE AND FARMING.

One of the many important facts in modern farm science most worth the attention of farmers who think, is the new system of feeding live stock. Present ideas which have grown from and out of old-time methods within comparatively recent years, put the whole feeding question on a truly scientific basis. The proportion and composition of foods is fully explained by agricultural science and wise breeders and feeders pay sufficient attention to the subject to reap great benefit from it.

Facts upon which the entire structure of the cattle feeding business rests are so well attested that there is no gainsaying them, and first and foremost in actual importance is the tonic idea.

It teaches one common sense principle—no animal under the continued strain of heavy feeding can make satisfactory growth or production without the digestive apparatus is strengthened to meet such strain.

To attempt to bring a fine bunch of thrifty steers up to the proper selling weight, or to get a large average production of milk from a herd of cows, leaving nature to settle alone the constant over-drafts made on animal digestion by big, daily rations of rich foods, is simply to upset the very end in view.

Give your cattle a tonic—something to strengthen digestion—and growth will be continuous because there can be no interruption caused by indigestion, loss of appetite or complications of a more serious nature.

Another great advantage in the tonic idea is its economy. Cattle receiving it, because of greater appetite, eat more rough fodder and thus reduce feed bills.

Eminent medical writers, such as Professors Winslow, Quitman and Finley Dun, tell us certain elements are always beneficial—bitter tonics, which aid and strengthen digestion, iron, well-known as a blood builder, and nitrates, which act as cleansing agents to remove poisonous matter from the animal system. These are the ingredients found in the tonic and healthy growth, production and condition are sure to follow in cattle, horses, sheep or swine when these elements are given.

STYLE.

A spirited horse in a shabby harness or rattling old buggy, has no more pride nor spirit than a self-respecting man has in shoddy and soiled clothing. The effect on the onlooker is likewise that of disappointment. A certain degree of style, finish and good construction is essential to comfort and satisfaction in a vehicle.

As the writer was passing a certain vehicle and farm implement house of Los Angeles recently, a bunch of vehicles caught the eye and compelled attention. There were all kinds of things on wheels. That was not strange for one may see such a sight any day.

The one thing which did compel attention, however, was the style and finish which attracts. They were the aristocracy of wheeldom, a pleasing sight, indeed. We wanted to buy a surrey, or carriage or phaeton, simpl because the appearance of comfort and finish made those things attractive.

The farmer nearly always has good, well groomed horses. Very often he also has them attached to a buggy which is no credit to the farm.

Considering the slight cost and long life, if well cared for, there is no excuse for any farmer to ride in any vehicle that is not a credit to his ranch.

The stylish vehicles mentioned above were in the sales rooms of Arnot & Co., 112-118 South Los Angeles St., Los Angeles, and is well worth inspection. Arnot & Co. keep a long line of mowers, rakes, balers, plows, harrows, heavy wagons, light wagons—every thing wanted on the farm.

Call on them or write your wants.

NEW SUBSTANCE TO REPLACE SHINGLES.

An interesting invention has been recently announced to the building trade. It is a substance which comes in rolls like ordinary "Prepared Roofing," so called but which has all the appearance on the roof of individual, diamond-shaped tiles.

The principle involved is novel and very interesting, yet so simple that we wonder it has not been used before.

The material comes in long sheets. Through the middle a saw tooth cut is made in manufacture. The halves are separated after the sheet is unrolled. One half is placed over the other when laying, thus developing the first course of tiles.

Each succeeding strip breaks up the strip underneath into these graceful individual tiles.

The sides of the material are slightly different shades of red, so that by alternating these sides in laying, a pleasing color contrast is developed between adjoining tiles.

This new material is called Zolium. Full information regarding this important invention can be obtained of J. A. & W. Bird & Co., Boston, Mass., who are the patentees and makers.

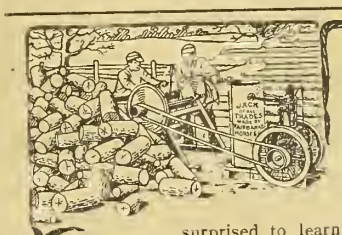
A GOOD FOUR-HORSE EVENER.

One of the most difficult things to get in the way of eveners is a good 4-horse Evener for a Gang, Sulky or Disc Plow. There are many kinds made—some homemade—others made to sell, but the majority of them fail to work satisfactorily.

There is a firm in Carroll, Ia., who has made a specialty of making 2-3-4 and 5-horse eveners for fifteen years and over and the big success they have made is the best proof that their eveners are the best on the market. We refer to the Heider Manufacturing Company, Carroll, Iowa.

Their eveners for Sulky, Gang and Disc plows are simply fine. Their 3-horse Evener is particularly good for use on hay wagons where loader is used, manure spreaders, etc., in fact, anything where they want to use three horses on an implement with a pole.

If you'll write a postal they will be pleased to send you their Evener Catalogue which shows a large line of their goods. They also manufacture some excellent ladders. Mention this paper when you write.



Why Break Your Back?

when a

Fairbanks-Morse Gasoline Saw Rig

Will do your work quicker and better than a dozen men at a small part of one man's pay. Then by sawing your neighbors' wood the outfit will often pay for itself and yield a handsome profit the first season. You would be surprised to learn how cheaply it will do chores for you, such as pumping, churning, grinding, etc. Made in either Portable or Stationary Types. Operates on gasoline, kerosene or distillate.

Changing Wheat Fields Into Orchards

TWENTY years ago Merced county was a vast wheat field, but the acreage devoted to the production of grain has been annually growing smaller, while fruit orchards and alfalfa fields and vegetable gardens have been multiplying in number and size, until the traveler in a drive over Merced county today will see large and thriving vineyards; he will see the orange, lemon and olive trees in abundance; he will see great orchards of apples, apricots, figs, peaches, pears, prunes, etc.; he will see many walnut and almond trees, and acres of peanuts; he will see the smaller fruits, strawberries, raspberries, blackberries, currants and gooseberries growing and yielding abundantly.

Merced county lies practically in the center of the San Joaquin valley, which is the big central valley of the State, comprising several counties. This county is sixty miles in length, from the foothills of the Sierras on the northeast to the summit of the Coast Range on the southwest. Its width from Stanislaus County on the northwest to Madera county on the southeast is about forty miles, the total area being about 2600 square miles.

Two large rivers, the Merced and the San Joaquin, flow through the county. In addition to these it has several smaller waterways—Chowchilla River, Bear Creek, Mariposa Creek and other small streams come into the county from the east, while Los Banos, Sycamore, Cottonwood, San Luis and other creeks rise in the Coast Range and irrigate the fertile lands of that portion of the county lying west of the San Joaquin River.

ALFALFA — $3298.00

ONE SEASON'S EARNINGS

It will pay every Farmer who reads this "Ad" to write us especially if interested in Clover or Alfalfa growing. We can refer you to a man who made $3298.00 in Alfalfa last year.

HE WILL TELL YOU HOW IT WAS DONE

We manufacture the machine shown in the cut; it threshes, separates, hulls, and cleans ALL the seed for market. No other machine will do it. You should write us and get our Alfalfa Booklet FREE. It will give you valuable information. Mention this paper.

At the County Fair Fifty Years Ago

An Entertaining Story Published in an Eastern Farm Paper in 1857, Which Shows That Some of the Amusing Things of 20th Century Fairs Were Noticed by Our Grandfathers

THE following amusing experience was printed in the Rural New Yorker. in 1857. It relates a condition, probably somewhat overdrawn, which prevailed at the ordinary county fair at that time. Some people have been cruel enough to say that the good old times of a half a century ago are not so much worse off than we are today.

This being about the time farmers are getting ready to "go to the fair" the lesson of" Smith's bull" and "Old Nance" may be of value. If so, we hope Cultivator subscribers will get "on the committee."

The page from this old paper was taken from a scrap book and forwarded us by E. A. Beard of Anaheim.

* * * *

Some years ago I got acquainted with one of your contributors who edited the Wool Grower, and he used to put me in print. I must say my vanity was flattered by seeing my name printed in the paper, with some things I said, and some I didn't say, and we've kept the papers ever since. After all, everybody likes a little fame, but some are satisfied with a smaller amount than others. Well, I have not the editor any more to set me out, so I have been thinking I would just try and see if you would not put me into the Rural on my own hook—especially as I want to tell you all about my going to the State Fair, at Buffalo, the other day.

Concluded to Go.

As it was not so far but what we could go with our own team, mother and I concluded we would hitch up and have a week to see the sights and some cousins we had not seen for a long time. Mother (that's wife, you know,) thought we ought to take something to the Fair. I told her to take a tub of her butter, but she said she didn't think it was good enough, but thought I might take some of the stock. But I thought it would be a great bother. However, Sam was pretty strong in the faith that we could beat everybody on horses, and wanted to take old Nance. She's a right smart beast, is that old mare, you may depend.

Takes the Mare.

Well, we packed off Sam, for I was willing to give the boy a holiday. It does the boys great good to attend these kind of Fairs, I do believe, after seeing all I saw there.

Goes In.

We got safely to town Monday night, and Tuesday I went up early to the Fair grounds to see what was going on. I got in and hunted up Sam, and found he'd got the mare entered, and had got his card on her head and a good stall, and all things comfortable. The animal arrangements were first-rate generally, and during all the time of the Fair the supply of fodder was good. I think that Maj. Patrick, who was everybody in managing things, a trump sort of a man

Hears Something.

As I was standing up near the business office in the crowd, I heard a couple of men talking about premiums. One said to the other:

"Are you an exhibitor?"

"Yes."

"So am I, and we had better look to the committees."

"Why so?"

"You see the committees are never all full, and if you are on hand at the big tent when they are called, it's easy to slip in a friend, which is a mighty nice thing sometimes."

"Well, I am showing a patent for making cowcumbers, and if you can get the premuim it will make my fortune."

"And I am showing a new kind of bob-tailed hens, and a premium won't set me back."

"Well, you get me on to your committee, and I will name you for mine."

"All right; go in to win when you can."

Thinks I, perhaps if that's the way the thing leans I may as well take care of myself as anybody else. Everybody for himself seems to be the rule on these occasions. So off I streaked it to the cattle pens to find Smith, who is my neighbor. you know. Smith is in the patent bull line. (Mr. P. evidently means "improved.") Says I, "Smith, you're showing bulls and I am showing old Nance, and I guess if merit counts we can win. And that's the talk here on paper." Then I told him what I'd heard about the committee.

"Is that so?"

"Exactly."

"Well, I think old Nance is the best mare in the yard."

"And you've got the best bull on the ground."

Then I told him that we must be up at the tent in time.

Well, sure enough, when the committees were made up I was on Smith's bull committee, and he was on the mare committee.

The Committee Goes Out.

The head man took the book as had the things in it, and we were all introduced to each other, and went down to look at the bulls. We were on the red bulls. So we went along and looked at them, and I didn't say much till we came to Smith's bull, and I looked at him pretty carefully, pulled his tail, punched my fingers into his ribs, and went through the motions as I had seen the others. Says I, "that's a bull that looks like it." Smith had combed him all over with a fine-toothed comb, and brushed him with a hair brush, and he did look slick, for he was just as fat as a hog. And from all I saw, I think fat at fairs, like what the lawyer said about charity, covers a multitude of sins.

Gets the Horns Poked at Him.

Just as I said that, the fellow who had a bull in the next stall comes up to me pretty fierce, and says he:

"What do you know about bulls?"

"Well," says I, "I think I know what they are used for in my section."

"May be," says he, "you are on the committee?"

"I have that honor," says I.

"But," says he, "that bull hain't got any pedigree."

"Well," says I, "he had father and mother, didn't he?"

"Oh! yes, but then nobody knows who they were."

"Well, then nobody knows but they were just as likely as your bull's parents."

"But, sir, look at my bull's pedigree. There it is, sir. Got by imported Shirt-tail, out of Skim-milk, by Thunder," &c.,—and he showed a string of names as long as your arm.

"Well," says I to the committee, "are we to judge the pedigree or the animal?"

And they said—"The animal, of course."

"Then," said I to the fellow. "will your bull get better stock than this?"

"Of course he will," says he, "for he's got a pedigree and that bull hain't."

"Well," says I, "your bull has got somebody to brag for him, and the other hasn't, that's certain." And that sort o' knocked him. "But," says I, "I've known people who felt grand over their pedigree, and I've seen a heap of people who couldn't go further back than their father and mother that banged them all to pieces for smartness. Handsome is that handsome does," says I, "and, as the hymn-book says, 'a man's a man for a' that.' Pedigree go to grass, I go in for the animal."

Smith's Bull Wins.

When we got through and looked at our marks, the other two had Smith's bull second. I had him first. So we talked it over, and finally, as they didn't care much about it, they altered the figures and gave Smith the first premium, which I think was right.

And the Old Mare.

Smith had a great time over old Nance. It turned out that each of the other two committee men had friends whose mares were to be judged, and they pretty soon picked out their favorites, So he kept still and let them talk, and they soon got into a quarrel, and then they appealed to Smith, and he kinder sided with one, but thought old Nance was the best mare, and finally, to keep the other from getting first, they sided with him, and he went in for both of theirs. Smith says he saw some queer things on that committee.

You see we got our premium, but you don't see, perhaps, Col., as well as I do, that it wants something more than merit to be sure of winning.

Gets Irreverent.

The State of New York is a great State, the biggest in the Union, and the New York State Agricultural Society is a great institution, but if there ain't some of the allfiredest big humbugs crawling around its Annual Fair, then I'm a teapot.—John Plowhandle.

The "new agriculture" is coming more and more on California ranches. The grain harvester has long been the most progressive of his class in the world. The California orchardist has put up the most attractive pack of fruits. The dairyman is now installing the milking machine. Co-operative marketing of the products has been more intelligently managed and more successful in this State than in any other. Let the good work go on.

From official sources it is learned that the demand for meat products in this country this year is about one-fifth less than in 1907. Trade papers had conservatively estimated the falling off in business at about 15 per cent, but from the office of the Armour Company in Chicago comes the declaration that the decrease in sales amounts to more than 20 per cent.

With the Citrus Growers

CITRUS CULTURE IN THE SALT RIVER VALLEY, ARIZONA.

AMONG the various lines of development resulting from assurance of irrigation water in the Salt River valley, citrus culture will be no small item. There are many acres of land on both sides of the river which are free from frost, have a good depth and appear to contain the necessary elements for successful citrus culture.

Already there is sufficient bearing acreage to assure the success of the industry and invite future plantings. Last year associated shipments from Phoenix reached nearly 120 cars, mostly oranges, but containing a few lemons and pomelos. Besides this several groves contracted for and successfully supplied the Harvey meal system of the Santa Fe route with its enormous traffic of tourists and commercial passengers.

The fruit ripens earlier than that of California and reaches the Eastern markets in prime condition for the Christmas trade. This, of course, is an important item in many ways since it insures good prices and is disposed of largely before the California fruit reaches the same markets.

There are those in California who fear that the development of this industry will come into competition with and perhaps interfere with California's market, but there appears to be little danger of this. Experienced California shippers have long ago warned the producers against premature shipping of unripe fruit for the sake of getting into the Christmas market. There is no doubt of the demand for fruit at this time, but the arrival of green, unsalable fruit to supply it is later a detriment to the brand which such fruit bears, and the market had far better be left to those who can get into it with satisfactory stuff.

The acreage, too, which can safely be planted in Arizona need not alarm the producers of California by its magnitude. Just how much there is of it is still to be determined and it is probable that many acres will be planted which are not adapted to citrus fruits and will do far better in other crops. This has been the history of all citrus belts and though Arizona growers are planting cautiously it is not probable that there will not be some mistakes in selection of soils and location. Some of the laud owners are already familiar with citrus culture and are prepared to cope with its whims and others are employing California experts or making trips into that State to prepare themselves for the new enterprise, or are otherwise protecting themselves against mistakes in planting and field practice. Fertilizing, cultivation and general care will not be slighted and every indication points toward rapid and successful development, thanks to an intelligent and industrious class of growers and a willingness to learn from the experience of California and Florida.

While the quality of the Arizona orange is still somewhat undetermined it is quite certain that it can be made to attain a fine texture, will keep well and meet the most fastidious demands in the matter of flavor.

Grapefruit is very popular and seems well adapted to conditions. It matures to a good size and a flavor which is fully equal to the famous Florida product. Large plantings of this fruit were made last spring and the indications are that it will receive nearly as much attention as the orange in future planting.

Contracts are now pending to have the fruit packed by an experienced packer from Riverside. Proper and approved machinery will be installed and a good pack insured. This party is fully aware of the necessity of careful picking and handling, and his contract will insist upon careful work in the field. Though this may seem to many a bit imperious at the present time it will be of infinite educatioal value for future guidance.—B. J. Jones, Phoenix.

KANSAS CITY RUMPUS.

Kansas City fruit dealers seem to have tried a game of freeze out on the Exchange handling deciduous green fruits. Then the Exchange came back with partial car sales. Regarding the conditions, the Chicago Packer says:

As a result of the sale of less than carlots of deciduous fruits in the market this week by the California Fruit Growers' Exchange at the same price at which carlots are sold there may be interesting developments in this section of the country regarding future distribution of the California fruits, both deciduous and citrus. It appears that the local trade has been buying practically all of its green fruits from California from the California Fruit Distributors, but that this spring the local representative of the California Fruit Growers' Exchange made an effort to sell some carlots of green fruit, but not meeting with success he announced to the trade a few days ago that he would sell any number of packages at the same price that carlots were being sold for and it was even declared by some of the dealers that the exchange delivered the fruit from the cars to the stores of the different dealers on the street. In some circles this selling of less than carlots by a concern which is generally understood to handle carlots exclusively is being strongly condemned and it was intimated this week by some in the trade that the exchange's efforts in this direction would likely interfere with its distribution of oranges and lemons next season.

Heretofore the exchange has not sold any green fruits to local dealers, but this season the exchange's representative here has made some effort in this direction, but, according to reports, did not succeed in making any sales of carlots. Failing to sell carlots he began offering less than carlots at the carlot price and this appears to be the cause of the disturbance at this time.

The exchange's local representative, Mr. Bragg, stated this week that he had been forced to sell in less than carlots because the dealers here who buy carlots and supply the trade had not made any purchases from him, although he had repeatedly offered cars, and, in fact, it appeared to be his opinion that the local dealers were making an effort to keep the exchange out of the market. He admitted that he was selling less than carlots at the carlot price but that he was forced to do so in order to get business.

In reply to this explanation of why the exchange was selling in less than

SAMSON WIND MILLS

carlots dealers here stated that there was no effort to keep the exchange out of this market. The only reason, it was asserted, why the exchange's principal competitor, the California Fruit Distributors, was given the business, was that the Distributors handled a large share of the California green fruits and was, therefore, in better position to fill orders at all times. As one dealer put it, "There is no good reason why we should buy from the exchange when we have been buying heretofore from other concerns and have been getting entirely satisfactory service. The concerns from which we have been buying have been able at all times to give up just the selection of fruit we want and when we want it and at the lowest prevailing market prices."

It is asserted that the exchange distributes comparatively few cars of deciduous fruits and for that reason is not always in position to supply just what the dealers want and this appears to be largely the reason why other concerns are favored. Whether the efforts of the exchange to force sales of deciduous fruits on the local trade will affect its trade in citrus fruits here the coming fall and winter is an interesting feature of the present situation and it was predicted here this week that in case the exchange persisted in doing a less than carlot business that the interested dealers would favor other distributors hereafter in the trade in oranges and lemons.

It was reported in the trade here this week that in case the exchange persists in its present method of splitting up cars and selling them at the carlot price that the matter will be brought to the attention of the Western Fruit Jobbers' Association for the purpose of having the association condemn any such plan. If the association should take such action it is thought likely that the exchange's business in various western markets might be hampered to some extent.

BETTER CARE OF ORANGE GROVES.

There is one thing that this paper wishes to call the attention of orange owners and care-takers to, and that is the better care of their groves, says the Exeter Sun.

A ride over the orange grove part of the county adjacent to Exeter will convince any one of the reason for this advice. To be sure a large number of the orchards are in the very pink of shape, but on the other hand there are quite a number in bad order.

Many of these which look bad now have been cared for to the best of the ability of the men in charge, but the trouble seems to have been they were not cared for at the proper time and the result is a bad looking field and trees showing the effects thereof.

Some of these groves are cared for by their owners and there is little excuse for their looking the way they do. Others are cared for by men who do it by the acre. Usually these men are the very best of experienced caretakers but in many instances they have taken on their hands more than they are able to do. They can only afford to keep a certain number of horses and at the time when nearly all of the orchards need attention they are at work in one or two and the rest must go until they can get to them which is often so late that they take considerable harm.

Other excuses are often put up for the difference in the fields but when tho road passes through two fields and one is full of grass and the trees showing yellow while the other is perfectly clean and the trees showing black and thrifty it seems like there can be nothing else but lack of attention to blame. These poor fields and groves are the bane of the country. Many prospective purchasers or planters look at them and shake their heads. They do not understand the cause and go away saying to themselves or friends that they will try some place where it looks better. There are places where it is the pride of every one, both owners and caretakers, to have their groves look clean and nice. These are the show places of the country. The land about there sells for a third more than when the orchards are less clean.

Mr. Orange Grower, how is your field looking? Is it one of the kind that visitors shun, or one that they go out of the way to see?

FRUIT AS FOOD.

It may be positively asserted that even the modern housekeeper, intelligent above her predecessors though she may be, still fails to appreciate the value of fruits. Nothing among all the productions of our bountiful mother can compare in richness and beauty with their hues and flavors. Above all they give tone to the digestive organs, antidote biliary derangements, and afford an innumerable variety of dishes at once delicate and nutritious. Who rightly values the worth of the apple, or of the date, that fruit which for three-fourths of the year furnishes the staple food of an Oriental race?

Every breakfast table in the land ought each day to have a central dish of fruit, either cooked or in its native state. Oranges and melons, apples and grapes, figs and dates, currants and the royal line of berries, cherries and gooseberries, plums and pears, apricots and peaches, bananas and grape fruits, all are rounded in outline, exquisite in coloring and delicious to the taste.

In one respect all fruits are alike. They should be eaten only when perfectly ripe and as fresh as they can possibly be procured. The unfortunate denizens of large cities may be compelled to consume them after being hawked about the streets and plentifully sprinkled with dust, but that is the price they pay for other privileges.

At the recent annual meeting of the Highland Fruit Growers' Association, the following were elected directors for the coming year: J. L. Yarnell, L. C. Waite, S. G. Lamb, W. D. Wagoner and L. S. Steele. J. L. Yarnell was elected president.

CONFIDENCE IN PINCHOT.

Confidence in the work of Forester Gifford Pinchot was expressed in resolutions unanimously adopted by the Tri-Counties Reforestation Committee at its quarterly meeting held recently in the Riverside Chamber of Commerce rooms. The resolutions were submitted at the close of a lively debate, and were prompted by the press dispatches telling of the charges that had been preferred against Mr. Pinchot by Congressman Smith, who accused Mr. Pinchot of entering into a secret understanding with the city of Los Angeles to enable that city to secure valuable water rights in the Owens River. Not only will a copy of these resolutions be sent to the head of the Forestry Department, but also to Congressman Smith.

FRUIT FROM MESQUITE.

Prof. Mason is interested in the report from Benson, Ariz., that experiments are being tried there of grafting fruit buds on mesquite trees. The mesquite trees are trimmed to good shape, and then there are grafted upon them cuttings from fruit trees. Mesquite trees will grow without irrigation, as their long roots seek moisture at a great depth, and if the experiment proves successful it would open great possibilities for the desert country.—Holtville Tribune.

BENEFITS OF PANICS.

Every industrial collapse which the country has had has brought some needed financial improvement. The panic of 1837 compelled Congress to establish the independent treasury, in which the government, ever since that time, has had control of its own funds. The panic of 1857, by destroying many of the wildcat banks, compelled changes in the laws in many States which strengthened the banking system of the country. One of the measures of the Civil war legislation was the creation of the national banking system. The panic of 1873 forced the dominant party to pass the greenback redemption bill of 1875, which went into operation in 1879, which brought all the country's currency up to the gold level in that year, and which has kept it up to that line ever since. The panic of 1893 compelled us to stop buying silver for the dilution of our currency, and thus saved us from a worse catastrophe later on.

I am not calling the flurry of 1907 a panic. Unlike the convulsions just mentioned there has been no general dislocation in the country's industrial and financial scheme. We have neither wildcat State bank notes nor irredeemable greenbacks to combat now, nor have we debased silver. Every dollar of all sorts of American currency is worth one hundred cents in gold today. Our industrial and financial conditions are inherently solid.—James W. Van Cleave in American Industries for June.

Deciduous Fruit Culture

GRAPE PACKING.

This is our first year on a California fruit ranch, and there are so many things we do not know. Your contributions to the Cultivator have been so very helpful to us. The article on grapes in the last issue was particularly interesting.

We have Sultanas, Flame Tokays, Muscats and Emperors. Most of our land, however, is in peaches, and it is our purpose to sell most of the available fruit green, drying what must be dried and making vinegar of the refuse.

We wish to put our goods up attractively and to make our label a synonym for good fruit, well packed. What sort of ribbons do you use on grapes, what colors, and how much? Do you pack the spaces with tissue paper, and do you use colors?

We are much dissatisfied with the coarse, unattractive paper which is all we have been able to buy for wrapping peaches.

We have not yet learned the addresses of houses where we may buy supplies of the sort we need. The ranchers of this valley are very unambitious, and for the most part buy their supplies in small quantities from the local packing-houses and take what is offered them and pay ruinous prices for inferior stuff.—Bee Josephine O'Mealey, Anderson.

Answer by Mrs. Sherman.

It is not always easy to relate the simple little things intelligently, perhaps, because we do not put them into words mentally, but simply do them. The grade of ribbon sells for $5.50 a thousand-yard spool. The order for grapes, Malagas and Emperors, eight-car pack, is as follows: Four spools of yellow like sample, 4 spools of white for blending, 2 spools of light pink, 2 spools of medium pink, 2 spools of light blue, 1 spool of medium blue, 1 spool of red, 1 spool of light green, 1 spool of lavender. The spools are strung on a home-made reel that allows them to turn easily. The ends of the desired colors are taken in the left hand and drawn out two yards, then folded back on themselves, again and again, until the loops are between five and six inches long; then the ribbon is cut from the reel and the ends tied tightly around the center of the folded ribbon, to make a "chou," the ends are left long enough to tie the ribbon to the stem of the grapes. The fancy bunches have often eight yards of ribbon on a crate, while the bunch pack is usually sufficiently decorated with a couple of yards to a crate. Sometimes the ribbon ends are left long enough to tie to the second bunch of grapes across the crate, and then a smaller chou is put on them. The variations are endless that suggest themselves while packing.

The colors are used singly, or two or three tints combined, often a dull-looking crate can be lightened into beauty by proper ribbons. Beefy tones can be killed by using blue and white ribbons, then the orange and amber tone of the grapes is accented to the eye, while a red or yellow ribbon would give the grapes a dingy look. The yellow and red ribbons come in to make a light-colored crate of fruit brighter. Tissue paper is not used in the grape crates, the bunches are cunningly put in to fill the spaces; indeed, we sometimes have to use more than one extra cleat, the packers get the fruit so high in filling the crates.

In packing peaches, the wrappers can be gotten in nice colors or in a good quality of white paper. The ranch name as well as the packer's name, should be on each wrapper. This printing can be done at the manufacturer's, and costs but a trifle extra.

Have the crate end of the grape boxes with your name or with the ranch name. The packers and the place of packing are required to be placed on the crate by the State laws. This box end should have something attractive on it. We have on ours in addition to our name and the ranch name, a picture of the brand.

VINEYARD FROM CUTTINGS.

TWO weeks ago I read the article about planting grapes—from cuttings and rooted vines. I send you photographs of my vineyard planted from the cuttings. It is three years old, and I have had it examined by expert vineyardists from Lodi and they pronounced it far ahead of anything they have in Lodi for the age. The berries will average 15 pounds to the vine. I will say that I intend to plant ten acres more this spring and I most certainly will set out cuttings. I had the photograph taken just a few days ago purposely to show you in fact that the idea of planting cuttings is a good one, and much better than rooted vines. If you feel like using the photo do so.

Your paper is a valuable one, and I cannot get along without it.—Robert Adams, Beaumont.

FRUITS AS MEDICINES.

In Modern Stories we find that fruits are divided by the famous French Dr. Dupoury into five classes: (1) acid, (2) sweet, (3) astringent, (4) oily and (5) mealy.

In the first he counts cherries, strawberries, raspberries, gooseberries, apples, peaches, lemons and oranges, and regards them as of great hygienic value.

Cherries he prohibits to those affected with neuralgia of the stomach.

Strawberries and raspberries he recommends to the bilious and gouty, and denies them to those affected with diabetes.

Of the sweet fruits he particularly values plums, especially for the gouty and rheumatic.

The small-seeded fruits, such as blackberries, raspberries, currants and strawberries are among the best foods and medicines. Their sugar is nutritious, their acid is cooling and purifying.

Grapes he awards the first place and thinks them the cure par excellence for the anaemic, dyspeptic, consumptive, gouty and bilious.

Bananas are recommended for the typhoid patient.

Lemons and tomatoes are cooling.

Lemonade is the best drink in fevers.

The juice of half a lemon in a teacupful of strong black coffee without sugar often cures a sick headache.

The apple is one of the best of fruits. Baked or stewed it generally suits the most delicate person.

Green figs are an excellent food and are laxative.

Prunes supply the highest nerve or brain food, dried figs contain heat, nerve and muscle food, hence are good for both cold and warm weather.

Sweet, ripe fruit in prime condition only is called a perfect food.

William W. Tracey will have charge of the United States plant introduction garden at Chico.

VITICULTURISTS TO MEET.

For the purpose of taking action looking toward the protection of the viticultural industry of California in any revision of the tariff which may be made, the Manufacturers' and Producers' Association of California has issued a call for a meeting of the wine grape growers of the State to attend a convention to be held in California Building Union Square, San Francisco, on Wednesday, July 22d, at 2:30 p. m. All interested in the subject are invited to attend. The association has called the meeting to insure proper recognition of the claims of this important industry in the hearings which are to be held before the Ways and Means Committee of the House of Representatives next November.

Imperial valley cantaloupe growers are feeling decidedly sore over the fact that while they received almost nothing for some of their larger shipments, the Eastern retailer, instead of being content with a reasonable profit, held for last year's prices, and what few sold cleared something like 400 per cent.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

California Horticulturally

SUBDIVISION IN SACRAMENTO VALLEY.

ONE of the signs of the times, and a good one, is the cutting up of the big ranches in the Sacramento valley. It indicates a large increase in population with the consequent increase in land values, making the holding of land in large tracts unprofitable. The latest in this line is the reported sale of the Haggin tract near Sacramento city. This body of land, known as the grant, comprises over 40,000 acres of the best land in the upper country; it hangs like an incubus over Sacramento, withholding so enormous a tract out of settlement and cultivation and has done more than any other one thing to keep back the prosperity of the capital city. It is now stated, and with some appearance of credibility, that this tract has been sold to a syndicate and will be cut into small holdings and sold to actual settlers. If this is is the case it will add largely to the wealth and population of Sacramento.

THE DESTRUCTIVE OAK MOTH.

The oak moth (Phryganidia californica) is doing great damage to the live oaks around the San Francisco bay counties, and especially in the Berkeley section. This is one of the periodical pests and appears in great numbers every three or four years, only to be reduced by its natural enemies, of which there are a number. It then remains unnoticed for awhile when it again appears. This is aparently its year for being here and it has shown up in such force that many of the grand oaks about Berkeley are defoliated and great damage is being done, in spite of the efforts of the University people to hold it in check.

MONEY IN APRICOT PITS.

Very many of the by-products of the orchard, which were at one time rather a source of annoyance than otherwise, have now a commercial value and add that much to the value of the fruit crop. We remember when apricot pits were burnt to get rid of them, and they made very good fuel, too, but now there is an active demand for them, and apricot driers have no trouble in disposing of them at very good figures. They are now a real asset of the orchard and not a mere waste product. In their transit to the East, these pits become transformed into almonds, and as such masquerade in many of the choice confections which are found in the Eastern market. Perhaps, as the apricot pit is sweet and nutritious and in many ways equal to the almond, the deception is not so bad, especially as it helps out the California orchardist and does no one harm.

THE RUSSIAN THISTLE.

The Russian thistle, of which little has been heard of late, has appeared in Butte county, and the people there have taken energetic action against it. A delegation of farmers and fruit growers recently waited upon the Board of Supervisors there and explained the threatening danger of this pest unless it is exterminated, and upon this representation the supervisors issued instructions to the Board of Horticultural Commissioners to proceed at once with its eradication. With the supervisors at their back, the Horticultural Commissioners have the power to compel people on whose premises this dangerous weed is found to kill it out and keep it down, and it is evident that they intend to do it.

A NATIONAL APPLE SHOW.

The Washington State Horticultural Association is arranging for a great apple fair to be held at Spokane on December 7th to 12th, and is making a strong effort to get all the apple growing States to participate. Valuable premiums have been offered and invitations have been sent to all apple growers to compete. It will, undoubtedly, be a great event and the Pacific Coast will have a chance to show what can be done here in apples. California should be well represented and, if we were, there would be another revelation to the horticulturists of the country, as great as when we walked away with the prizes against the world for oranges at New Orleans. California can grow apples, she can and does grow the best apples on earth, but few know this and few believe it. If we prepare now to take part in this contest and do our best on that occasion, we shall walk away with the prizes against all comers, as we did in the orange case, and California's reputation as an apple State will be made and another great field of horticulture will be extended.

WANT THRIPS INVESTIGATION EXTENDED.

The State Board of Trade, which is ever among the first to move in the interest of the fruit growers has applied to Secretary Wilson for an increase in the force now engaged in the study of the thrips and its work in Santa Clara county. At the present time this work is being carried on by Dudley Moulton and Chas. T. Paine, his assistant, who are doing excellent work though limited in its field. The thrips, an insect so small as to be barely visible to the naked eye, is doing such serious and wide-spread destructive work that it threatens the future of the prune industry of the State. Its work, too, is not confined to prunes, but it attacks peaches, pears and all varieties of plums. It has totally ruined the crops in many orchards this season, and in a season of abundant fruit, they will yield nothing. Some means of checking this pest must be found, and it is to be hoped that this effort on the part of the Board of Trade will meet with success. There is little doubt of this, however, as the Department at Washington has ever shown an anxiety to be of service to the fruit growers of California, as is evidenced in the many investigations now being conducted here.

SLANDERING THE LADYBIRDS.

We hear frequent complaints to the effect that green ladybirds are doing great damage to melon vines, or cucumbers or to flowers or plants and asking for a remedy. It is to be regretted that the name ladybird is so frequently applied to one of the greatest of our insect pests, as it brings the true ladybird into disrepute and it is often charged with, and sometimes destroyed for, the sins of the pest which has recieved its name. The "green ladybird" is not a lady bird, nor does it belong to the ladybird family. Its name is Diabrotica, and in California we have two especially destructive forms of the pest, the Diabrotica vitta, the gueen and yellow striped beetle which attacks melon, cucumber and squash vines and sometimes attacks them in such swarms as to destroy the vines, and the Diabrotica 12-punctata, the spotted variety which attacks our fruit and flowers. They are much longer in proportion to their width than any of the ladybirds which are more spherical in shape, they have long feelers, while the ladybirds' are short and clubbed, and their habits are entirely different. Ladybirds are beneficial in all their stages, this pest is destructive in all, yet we have known people to destroy ladybirds which were doing good, because the Diabroticas were doing harm and they believed them all to be ladybirds. No effective remedy for the pest is known as it attacks plants and fruit at a time when applications of insecticides would not be safe, otherwise Paris green could be recommended. Hand picking in the early morning while the insects are somewhat dormant is the only effective method of checking them.

CHERRY FAIR.

The Salem Cherry Fair is postponed from last week till this and is being held today, tomorrow and Saturday.

The management sent out one of the neatest illuminated post cards we have seen in invitations to the show.

Walla Walla cannery opened on Royal Ann cherries on July 1st.

Placer Nurseries

We have now growing for next season's delivery a large stock of all leading varieties of trees and vines. We propagate only the best commercial sorts. Our trees and vines are the best that good care can produce and in their selection, propagation and growing we spare no labor or expense; and they are true to name. That is what you want.

Contract now the trees and vines you will want for next season's planting.

Write us.

General Agriculture

NEED OF FARMERS' ORGANIZATIONS.

IN THIS day of combinations, the individual does not count. Unless a man can prefer demands, however just they may be, backed by the strength of numbers, he will receive scant attention. Let the individual go to a railroad, an express or other shipping company with complaints of unfairness and while he may be politely listened to, it is certain that he will get no redress; but let him go in the name of an organization, and the stronger the better, and he will be more than listened to, his demands will be carefully considered and, if they are at all just, you may depend upon it they will be granted. So it is in politics, and it is here that the farmer is most ignored, for he does not bring the force of numbers to back his just demands, while organized inferiority gets all it asks. The farmers represent the largest number of our population; they also represent the most intelligent and are the class upon whom the prosperity of our country primarily depends, yet in politics they have not the power of the Hod Carriers' Union, composed almost wholly of foreigners and men with no direct property interests in the country. And so it is all along the line. The citrus growers of the south have a strong organization and they get concessions as they ask them and are prosperous. There is no reason why the most important class of men in the country should be ignored while their inferiors carry everything, except that they cannot bring the force of numbers to back their demands. Organize, get your organization to affilliate with other organizations, make yourselves felt in trade, business, politics and soon the farmer will take his proper place at the head of our industrial forces, and get all that he justly demands and be prosperous as he should.

WHY FARMERS SHOULD BELONG TO THE GRANGE.

The above heading is the subject of a prize essay written by Miss Nina Taylor, of the Rockwood school in Multnomah county, Oregon. The grange there had offered three prizes for the three best essays on the subject mentioned. The essay is as follows:

"Every farmer should belong to the grange because it is a farmers' association.

"Men who work for wages at almost any business have business associations; the carpenters, the plasterers, the machinists, the plumbers, and men who work at all such trades have trades unions or associations. The grange is the farmers' association, and in the same way as the trades unions benefit the workers, the grange benefits the farmers, but to a greater extent.

"If all farmers unite and form a strong body they can send delegates to the state legislature and demand almost anything that would be good for the farmers in general, such as having new roads and bridges built or improving the country in any way.

"The grange also furnishes a place for the farming, dairying, gardening, and stock raising.

"Another reason is that in belonging to the grange a farmer can have his farm implements, his buildings, his stock and his household articles insured at a cheaper rate than in any other insurance company in the world. This insurance company is sure not to go bankrupt because it is a national organization, and there is such a large amount of insurance all over the country that if a very destructive fire did come in one part of the country the insurance could be paid without the slightest danger of the company going bankrupt.

"The grange has done many things for the good of all the farmers.

"It has been the means of getting free delivery of mail to all the country places. It is now working for a government road across the country.

"The grange also furnishes a good place for young and old people to go."

INEXPENSIVE PAINT.

Dr. J. L. Roberts of North Yakima, Wash., writes as follows to the Pacific Homestead:

"There is little or no excuse for farm buildings going on for years, or one year, without paint, when it can be supplied so cheaply as I have done very recently.

"I have painted my house (a small one) with a preparation of hydrate of lime and skim milk. No special proportion of each; simply take one or two gallons or more of skim milk and stir in the lime until it is about the consistency of thick cream—in fact, the above combination will look much like rich cream. The dry hydrate of lime is of a pink tinge, so the mixture will be the color of cream. When applied and dry, which will be in less than two minutes, it will be lighter. Apply with a whitewash brush or mop. The milk makes it a 'fast color.' I can lean against it with my best black coat and leave no mark on the coat.

"Many years ago I painted my father's prairie farm house with water-lime and milk. That left a light lead color and lasted for years. I have never tried pure lime, but I believe it would make a clear white paint.

"To make a red paint, put in venetian red.

"The limit to experiments would be at the end of the list. A few cents spent in experiments may result in dollars of value. Farmers who have cows ought to have plenty of skim milk, and lime is so cheap that every building on the farm could be made presentable with so little expense that it would pay in heart satisfaction, if nothing more.

"Of course, this is not intended for expensive buildings, but cheap buildings, sheds, etc., which are hardly ever painted. Just try it and see if some of your neighbors won't be calling to see if your place hasn't changed hands."

CALIFORNIA — RESOURCES AND POSSIBILITIES.

The Eighteenth Annual Report of the California State Board of Trade, now before us, is a document worthy of perusal by the homeseeker, the tourist, the political economist, and the general reader. It is replete with information of interest and value to every one desirous of adding to his knowledge of the Golden State and its vast resources, and the wonderful growth of her varied industries, since she entered the sisterhood of States, less than sixty years ago.

The work of the California State Board of Trade is for State development, and the institution is in a position to give full and accurate information in regard to the State in response to inquiries which come in numbers from every part of this country, as well as abroad. This information, as well as the reports and ilustrated literature regarding the various countries and districts, is given or sent out free to all inquirers.

The next session of the Farmers' National Congress will be held at Madison, Wisconsin. A fine program, many attentions from the citizens and an opportunity to see this college, should attract a large attendance. Geo. M. Whitaker, Washington, D .C., secretary.

Unorganized farmers may be successful as producers, but organization and co-operation are necessary for successfully marketing crops after they are made and prepared for the market.

Live Stock and Dairy

ADVANCED DAIRYING.

THE time surely has come for the formation of testing associations or clubs in this State. In the Middle West these farmers' associations are developing the native cows at small expense. One thing noticeable is the demand for improved blood. The sires are more carefully selected; the son of Tom Jones's best cow Mary is no longer good enough. It must be something a good deal better; something with a long name and a number, certified to by a good breeders' association. The testing brings about a number of things. It brings uniform cows for one thing, for the sires are too expensive to be used by merely one man for one season and then made into beef. A system of exchange is growing up; one after the other, the bulls are sent to the next club after one club has used them for a time. Any one having had aged, tested sires that have had to be made into bologna sausage knows how many fine bulls are sacrificed because no one wishes to pay for the transportation of a large animal when he can buy a calf and, even if he pay more for him, save on the transportation charges. Any man of enterprise, if he will watch his neighbors who have registered stock, can pick up five-year-old tested sires very cheap. If he has a grade herd he need not care for the registry papers. Many breeders do not like to let the old chap go with his papers, for fear it will be considered as cheapening their stock.

Love of Good Cattle.

Any one who really loves the breed he is interested in wishes others to have it as well as himself. It seems like a great waste to have a mature animal that has given good service sell to the butcher for thirty-five or forty dollars when there is good blood there to improve someone's common cows. Under a testing association the sires that have proved themselves superior could be passed on until too old for further use. The raising of grade cows where a registered sire is used proves very profitable. The grade milk herd quickly climbs into value. Cows seemingly good are offered at $35.00 a head. Yet we never have had to sell ours for less than $75.00, some for a good deal more. We have only one grade cow left and the neighbors at the upper ranch (where she is kept as a milk animal) are anxious to buy her at $80.00. We keep her as we do not care to risk a more valuable animal away from home and under any kind of care. The people do believe in improved blood after all; though they may scoff they will pay in cash for a good grade.

Registered Cows.

There exists in many farmers' minds the idea that pure breed cattle are delicate and require more care than common stock. This probably comes from the fact that the man who breeds fine cattle has the knowledge that care and shelter make the feed bill less and, therefore, the profits more. This is a correct view to take and even the man with scrub cattle would find it true of his poorer stock. As to being more tender there was never a greater mistake, for the advanced registry test when made for thirty, a hundred days, or for a year's time is a severe one. It shows that a cow has perfect digestion, for the least falter in her appetite shows in the amount of milk and the butter fat at once. There is a bulletin, indeed two of them, now no longer new, that should be studied by every one handling milk cows, Bulletins 51 and 66 of the Agricultural Experiment Station of the University of Illinois. Professor Fraser records two cow's performances at the pail. Eva and Janet come first. Eva gave nearly 50 per cent more milk than Janet and about 12 per cent more butter in a ninety-day test. She made this extra butter without eating any more grain than Janet and only about 8 per cent more roughage of hay and fodder. This statement is made without giving the decimals as they always seem to me to lessen the force of the amount by making one think of them and for grasping the amount of difference they count very slightly. Eva was so much the better producer that she made 1050 more pounds of milk and 12 pounds more of butter out of the additional 112 pounds of corn fodder and hay she received. With one cow the difference is not great, but in ten cows see how much the man who owned the Evas would outstrip the man owning the Janets in his profits.

Rose and Nora.

There are two other cows, Rose and Nora, that were both continuous milkers, remaining in milking for twelve months. When put on the full rations, Nora gained during the nine months of testing 161 pounds in weight while Rose gained 181 pounds. This gain in weight during the testing shows the feeder that the cows are getting all they can use in milk making. It is the test of feeding. All cows should be weighed once or twice a month and then the feeding be regulated according to the way the herd is gaining or losing in weight. Rose ate a little more food, 4.6 per cent than Nora. What did she do with it? She gave 139.5 pounds of milk for every 100 pounds that Nora made. While Nora was making 100 pounds of butterfat Rose made 180 pounds. This cow Rose like all great cows made this on her vigorous digestion and good assimilation and she lasted for years. I owned a cow of this type once, for like Rose she could keep it up. Rose did keep it up for ten years, making 384 pounds of butterfat yearly.

The best cow of whose production I have continuous records was Lady Kathleen. She produced as a heifer 277 pounds of butter, then went into the 300 pound class and after two years into the 500 pounds; then into the 600 pound class where she remained for four years. She was sold with the rest of the herd of older cows. This cow was a continuous milker never dropping below 15 pounds at a milking during eight years; she never was dry until after I sold her. She was then taken from a good feed and dried off by forcing her down in condition; she did go dry but never recovered from the shock of the thinning down and of the loss of her milk flow.

The cow accustomed to liberal feeding and then to being milked daily will suffer the same as a person would from a corresponding deprivation. Let any one have any disease that

GET ABOARD!

1908 SEASON OF

De Laval

CREAM SEPARATOR PROSPERITY

De Laval Cream Separators and farm prosperity almost invariably go hand-in-hand. The farming outlook was never before so promising as now. First and always best as they have been for thirty years the De Laval Cream Separators were never before so good as are the new and improved 1908 machines.

Midsummer, the most profitable separator season, is now nearly at hand. There was never a better time to make this most profitable of all farm implement purchases. It's high time to get aboard.

Why not see the nearest De Laval agent and order NOW?

Pioneer RUBBER SANDED ROOFING

WRITE FOR SAMPLES AND BOOKLET

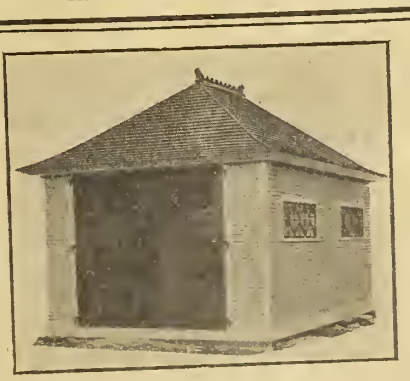
LET US PUT YOU IN TOUCH WITH OUR LOCAL AGENT IN YOUR COMMUNITY

Rubber Sanded Roofing is successfully used on flat as well as pitched roofs—residences, hotels, business blocks, out-houses; anywhere that a rain-proof, sun-proof roof is required.

Comes in handy rolls; easy to lay. No special tools needed. Everything in the way of nails and liquid cement for laps furnished in center of each roll, without extra charge.

Pioneer Roll Paper Co. Department 11 Los Angeles, California

Makers of Rubber Sanded and Rubber Flexine Roofing and Refiners of Asphaltum



The Barker Portable Cottages, Bungalows, Garages, Tent and Poultry Houses

These houses are correctly built of selected material and are so different from the ordinary portable houses as the aim has been to make them look like a permanent structure built on the ground. They have stood the test of years and are conceded by experts to be the best, cheapest and most practicable portable house made. Please investigate before purchasing or building. We also manufacture sanitary poultry houses of our own designs. Write or call at office and factory, corner of Topeka and Alameda Streets, Long Beach car line.

wastes his flesh and then see how long it is, sometimes never, before he recovers fully the bodily tone that enables him to work to advantage. The food puts in the spirit and spring; the milk flow regulates the amount of food assimilated; suddenly stop all this and the cow goes to pieces. It is often argued that nature does not have an animal in milking for more than the short period of nursing her young. Yes. But we are a long way from nature ways. She expects the cow to run on green grass and the food to lessen in succulency and the cow to go dry at the same time. We keep up the feed and then we breed only the cows that are good continuous producers, for generations, yes, since Mrs. Noah took her lean old cow into the ark. Then, after we have subdued nature to the artificial education of the dairy, suddenly we try to plead nature's old fashioned way to the cow. Don't do it.

Two More Cows.

Professor Otis speaks of two Wisconsin cows that illustrate the difference between cows. In one man's herd the two best cows produced 419 pounds of butter per cow yearly. Adding the butter produced by the poorest cow in this herd to that of the two best, the record was lowered for the three to 313, or a reduction of 106 pounds in the year. In another herd the two best cows produced an average of 427 pounds yearly; adding the yield of the poorest cow, the average came down to 301 pounds, a loss of 126.

One poor cow in a herd may make a big difference after all. She eats like an ulcer into the profits. She hurts the pride even worse than she hurts the pocket when one comes to average her up on the test book. If a cow becomes thin when in heavy milking it is easy to give her a little more grain. When she grows fat check up on the grain a little. When the fat appears on the ribs the cow is overfed; she is not making good for the grain. When she is having all the green food she will consume, but little grain is needed for the 300 pound of butterfat cow. The cow that goes above that mark needs to be grain fed carefully so that the grain is not wasted, but consumed or rather taken up in milk forming.—M. E. Sherman.

MOLASSES AS FEED.

The feeding value and digestibility of molasses are discussed on the basis of work at the Massachusetts Station in a bulletin a follows:

For fattening beef cattle the authors believe that some 3 lbs. of molasses per day may be fed advantageously, especially during the finishing process when the appetite is likely to prove fickle.

When molasses was tested for horses two lots of two animals each were used and were fed for two periods of four weeks each, the rations being reversed during the second period. The grain ration consisted of 7 lbs. per head per day of corn and oats about 2:1, and the molasses ration of 4 lbs. of molasses and 3 lbs. of the same grain mixture. Both lots were fed 15 to 18 lbs. of hay per head per day. On grain and hay there was a total loss of 45 lbs. and on the molasses ration a total gain of 20 lbs.

"The several horses were in good condition at the beginning of the trial and no particular effect, favorable or otherwise, excepting a logy condition, was noticed from the 4 lbs. daily of Porto Rico molasses. The feces maintained their normal conditions in all cases. It is evident that the amount of molasses was out of proportion to the amount of grain fed.

"In spite of the many reports favorable to the use of molasses for horses, the writer is not inclined to recommend to northern farmers its indiscriminate use in place of the cereals and their by-products. As an appetizer and tonic for horses out of condition, as a colic preventive and for improving the palatability of rations, 2 to 3 lbs. daily of molasses undoubtedly would prove productive of satisfactory results."

Several rations containing molasses are suggested.

In a test of the value of molasses made with two pigs the maximum amount which could be fed with satisfaction was 57 oz. of molasses per head per day with 8 quarts of skim milk and over 40 oz. of hominy meal. After feeding for some twenty weeks the pigs were slaughtered.

"It was not possible to detect any abnormal condition of their internal organs, nor of their dressed carcasses. No particular study was made relative to the quality or chemical composition of the fat. It was noted that neither of the animals was excessively fat."

"If molasses is used for the nutrition of pigs, it must be mixed with foods reasonably rich in protein. If skim milk is not available, a combination by weight of two parts bran, one part gluten feed, one part corn meal and one part molasses; or one part tankage, four parts corn meal, and one part molasses ought to prove satisfactory. The writer sees no particular advantage under ordinary conditions for the northern farmer to employ molasses for pig feeding other than as an appetizer."

In a test of two lots of three dairy cows each molasses and corn meal were compared, the test covering two periods of five weeks each, separated by an interval of two weeks, the ration being reversed in the second period. The molasses was diluted with water and mixed with dry grain before feeding. On the molasses ration there was an average gain of 10 lbs. and on the corn meal ration of 67 lbs. The daily milk yield on the two rations was 18.04 and 19.65 lbs., respectively, the corn meal ration showing an increase over the molasses ration of 11.3 per cent. total milk solids and 13.1 per cent. total milk fat. The cost of 100 lbs. of milk on the two rations was $1.28 and $1.19 and the cost of 100 lbs. of butter $21.50 and $19.41, respectively.

Any particularly favorable effect of molasses upon the general health and appearance of the six milch cows employed in the above-described experiment was not observed. The feces from the molasses-fed animals were darker in color and softer than from those receiving the corn-meal ration.

"A daily ration containing nearly 4 lbs. of corn meal produced some 10 per cent. more milk and 11 to 13 per cent. more total solids and fat than a similar basal ration containing a like amount of molasses.

"The molasses ration seemed to produce milk with slightly less fat and solids-not-fat than did the corn-meal ration.

"A like amount of milk and butter from the molasses ration cost 8 to 11 per cent. more than from the corn-meal ration.

"Molasses did not produce any un-

MORE MILK—MORE MEAT

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.

favorable effect upon the flavor of the milk. . . .

"As an appetizer for cows out of condition and for facilitating the disposal of unpalatable and inferior roughage and grain, 2 to 3 lbs. of molasses daily undoubtedly would prove helpful and economical."

When a commercial molasses feed was compared with wheat bran and gluten feed, the total milk yield of four cows on the former ration was 7,357.4 lbs. and on the bran and gluten ration 7,639.6 lbs. According to the author's calculations, there was an increase of 6.8 per cent. total solids and 6 per cent. total butter fat on the bran ration as compared with the commercial feed ration.

In a test with another commercial molasses feed the average daily milk yield on the molasses feed was 16.76 lbs. and on the bran and gluten feed 18.61 lbs., the bran and gluten ration being superior by 13.2 per cent. total solids and 14 per cent. total butter fat.

HOW TO MILK PROPERLY.

The milker should observe strict personal cleanliness. When milking he should wear a special suit of washable overalls and jacket or a long washable apron with sleeves. It is necessary that he should have three or four changes of milking suits or aprons. The hands should be washed and the finger nails be cut close and well brushed. After milking one cow he should thoroughly cleanse his hands before milking another, because this insures greater cleanliness and prevents the transmision from one cow to another of such diseases as infectious garget and cowpox. The practice, which is too common, of wetting the teats with the milk, and milking the cow entirely by stripping, cannot be too severely condemned. The milking should be done with the full hand by producing a wave of pressure that begins at the upper part of the teat or the lower part of the quarter and passes down over the teat to its lower end; this is produced by the successive closing of the thumb and fingers in a grasping manner. This involves no pulling or friction, and every drop of the milk can thus be removed from the udder. By using the stripping process in milking the friction and pulling causes scales and dust particles to fall into the milk.—Portland Oregonian.

CHAMPION TROTTING STALLION OF THE WORLD.

After several weeks of cabled negotiations, Cresceus 2:02¼, champion trotting stallion of the world, has been sold by M. W. Savage, of Minnesota, to one of the most prominent of Russian horsemen, Tshemerzin by name, and a resident of St. Petersburg, for $25,000.

The closing of this deal is the culmination of a series of interesting incidents extending over the past three years, and is the result of very persevering efforts on the part of a group of Russian horsemen to get possession of the great son of Robert McGregor.

Since the stallion has been quartered at the Savage farm there have been several attempts to buy him by the same subjects of the czar. Persistency finally won; Mr. Savage was induced to put the price of $25,000 on Cresceus, and when the Russians acceded to his terms there was little for him to do but to accept.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.

LUMP-JAW.

Lump-paw is a germ disease called actinomycosis. It is a mold germ, and will live on the grass. Where the disease is in the glands, it is best to have a qualified veterinarian dissect the tumor and gland out entirely and it will heal up nicely. But where it is in the bones it is hard to treat and it would be best to give chloride of potassium 2 drams twice a day for eight days, and then wait about two weeks and repeat. This will cure it as a rule in the glands and reduce it when in the bones long enough to fatten and market the animal, which is the best way to do when the disease is in the bones. One animal left in a herd with a case in the bones running will give it to a great number in a herd in one season. It should be tied up or kept by itself.

Away back when the writer was a boy, artichokes were planted for a winter and early spring pasture for hogs. Years ago they went out of use, however, though they seem now to be coming in use again. They are richer in food elements than potatoes, and are said to yield more tons of feed to the acre than potatoes or sugar beets. Any fair corn ground will produce them. Plant in the spring cultivate lightly, and turn the hogs in when the ground is not frozen in the winter and spring; they will do the rest. If not pastured too close, enough artichokes will remain in the ground to reseed it.

Dehorning the calves is much nicer and more humane than taking the horns from older animals. A little caustic potash, that may be had at any drug store, dampened and rubbed carefully and well on the horn button of young calves, say from one day to two or three weeks old, will do it nicely—the animal will never grow a horn. And the operation is no more painful than a slight burn. Don't let it touch the bare fingers.

The carelessness displayed by some farmers in handling young colts is inexplainable, since so much of the future usefulness of the animal depends upon its first handling. The colt should be broken early, and it should be broken right—won by kindness and taught as a thing of life—sensitiveness and intelligence.

More than half of the animal body is water. A fat calf is about 65 per cent. water, a medium fat yearling is 60 per cent. a fat two-year-old is 52 per cent., while a fat sheep may be only about 43 per cent. water.

Almost any kind of pasture is good for the ewes and lambs now, except that it must be high ground. Wet, sloppy pasture will not do for sheep of any kind at any time.

Hog raisers should never use scrub males. In this progressive age they should not use scrub sows, but even Uncle Threadbare is unable to find an excuse for using a scrub male.

If the sows are short of milk for their pigs, a slop of middlings and bran is a milk-increasing feed.

THE WHOLE THING.

"What part of speech is 'woman,' pa?"

"Woman isn't a part of speech, my son. She's the whole speech."—Home Herald.

HELP APPRECIATED.

In speaking of the effort to exterminate the white fly in California, State Horticultural Commissioner Jeffrey recently said in the Los Angeles Times:

"In behalf of one of the largest horticultural offices in the United States, I wish to thank the California Cultivator and other agricultural journals for the appreciative treatment given the efforts to destroy the Florida white fly in this State. The task has indeed been herculean, as the Cultivator states, and the detail involved and the actual physical labor expended mark these campaigns unique in the history of insect extermination. After another year of vigilance, if the destruction of this pest is as certain as it now seems, more attention will be given to the introduction of enemies of the white fly. If such enemies are found they will be sent to Florida, with the view of lessening the amount of pest there and thereby securing further immunity from its introduction from Florida. If the white fly is extirpated at Marysville and Oroville the achievement will silence the critics who said it could not be done, and it will mark a new era in the handling of large insect infections."

In conversation later with Mr. Jeffrey we were informed that he has the strongest hope that this campaign against the white fly has succeeded in the complete extermination of this pest. Sure it is the work was energetically taken up and carried out by the commissioner and deputies and we doubt not the appreciation above expressed for the support of the press is equally as hearty on the part of the larger fruit interests for the work of the commissioners.

And while this appreciation for the workers in the field is being expressed, let us not forget the sacrifice made on the part of the people at Marysville and Oroville, who were compelled to stand by and see the trees that they had regarded with affection for so many years destroyed that this pest might be wiped out of existence. To be sure all did not do this with perfect willingness, but it was done, and the loss was very great. It is fitting that those who sacrificed in this way should be remembered.

Let us hope that this work will be followed until absolute certainty exists as to the complete destruction of the dreaded pest. Mr. Jeffrey and his deputies will, we believe, be sufficiently alert to accomplish this.

SAVE THE RAKINGS.

A close estimate on the value of manure rakings from the dairy yards of this country is that it will aggregate a total valuation of $648,000,000.00. Such a vast sum seems almost inconceivable as coming from such a source, and the figures should be valuable as setting the dairymen to thinking how that which is so often freely wasted can be handled more economically. Too often this waste product is considered in the light of a nuisance rather than a wealth builder. It has been taken from the farm and should be returned and as carefully conserved as possible. Our farms have been under cultivation, many of them, for years, and should, year by year, increase in fertility. Rather, they have decreased, and instead of building them up we have moved on from State to State and now vast hordes of our people are even crossing the line into Canada for the rich native soil there offered. Such a wasteful scheme is almost unthinkable, but is continually followed and with, apparently, a good conscience on the part of those who are wasting our patrimony. No surer way of paying off the mortgage or of increasing the bank account is to be had than by being careful of this which is so often wasted. "If we, here in America, shall teach the world how to use land without abusing it, we will have written a new page in history."

MILLS MOVES TO MARYSVILLE.

J. W. Mills, who has been in the employ of the State University as director of the Pomona Experiment Station and later of the Citrus Experiment Station, and also in charge of Southern California field work for many years, has given up his connection with the State work and has moved with his family to his own ranch, "Linda Vista," east of Marysville, Yuba county. Mr. Mills' connection with soil investigations and practical field work with both deciduous and citrus fruits for all these years, has fitted him to take up this work on his own farm in a way which we believe will be a complete success.

His ranch consists of ninety acres of beautiful Sacramento loam land. One of his principal crops will be alfalfa, but he will plant as soon as possible five acres of oranges and now has about fifteen acres of table grapes in bearing. The knoll on which the house will be built is surrounded by trees and vines which have been planted for several years in anticipation of the home being built. From this knoll a beautiful view is obtained of a sweep of country and this gives the name to the ranch. It is in the township of Linda and the beautiful view from the knoll makes up the name of "Linda Vista."

We wish for Mr. Mills complete success in his new home and are glad to announce that he will continue as contributor to the citrus and deciduous departments of our paper.

SUPPORT THE DAIRY INDUSTRY.

The State Creamery Operators' Association has adopted a button bearing the inscription, "Liberal Legislative Support for Dairying." Several thousands of these buttons have been ordered and will be distributed among the friends of progressive dairying and it is hoped that they will aid in securing legislation in this State favorable to the dairy interests.

BRYAN AND KERN.

The brilliant leader of his party was easily and quickly nominated by a most enthusiastic following at the Democratic National Convention last Friday. But little opposition was developed and practically Mr. Bryan was nominated by acclamation. The platform, so far as the two main planks of interest are concerned, goes farther than that of the Chicago convention, but it is doubtful whether in the last analysis the labor plank will be much more satisfactory to those demanding a restraint of court injunctions. The tariff plank, as might well be expected, is stronger and more definite. The old, old issue of "tariff" is again to the front.

CROP NOTES.

The average condition of barley on July 1 was 86.2 per cent of a normal, as compared with 89.7 last month, 84.4 on July 1, 1907, 92.5 on July 1, 1906, and 88.3, the ten-year average on July 1.

The acreage of Irish potatoes is estimated as 3,198.000 acres; that is, 2.4 per cent, or 74,000 acres more than last year. The condition of the crop on July 1 was 89.6 per cent of a normal, as compared with 90.2 on July 1, 1907, 91.5 on July 1, 1906, and 91.6 the ten-year average on July 1.

The condition of the apple crop on July 1 was 57.6, as compared with 66.0 on June 1, 44.0 on July 1, 1907 and 62.3 the ten-year average on July 1.

The average condition of the corn crop on July 1 was 82.8 per cent of a normal, as compared with 80.2 on July 1, 1907, 87.5 on July 1, 1906. 85.6 the ten-year average on July 1.

Shop Talk

A SUGGESTION.

A subscriber at Kingsburg, renewing for the paper, suggests that where items of interest are published the name of the county follow so readers can locate the neighborhood.

California is a wonderfully large State, and withal a comparatively new one. Its development began in '49 and is now but fairly started. New postoffices and towns are appearing every day. It is difficult for an average reader in the northern portion to locate many towns in the south and the same difficulty obtains throughout. Until one attempts to thoroughly familiarize himself with the geographical location of the various counties and towns, the immensity of the State is seldom appreciated. As will be noted in "Agricultural notes" of North, South, Central and Coast, we endeavor to follow the suggestion.

POULTRY BOOKS.—When remitting renewal of subscription, if interested at all in poultry, don't forget the books which we have recently advertised, and which may be ordered through this office. For a very little in addition to the price of the paper we can supply you with the ones which interest you most. The list follows, but if possibly one is wanted which is not mentioned, write us and we will quote price by mail, if obtainable. The remittance must come direct to the office, but may be for either a new subscription or a renewal.. In the event that the **Cultivator** subscription is already paid up and you desire to order a book separately, it will be sent at the regular price, as quoted.

Diseases of Poultry, by D. E. Salmon, 50 cents. With **Cultivator** one year, $1.25.

Leghorns, 50 cents. With **Cultivator** one year, $1.25.

Ducks and Geese, 50 cents. With **Cultivator** one year, $1.25.

Turkeys, 50 cents. With **Cultivator** one year, $1.25.

Money in Squabs, 50 cents. With **Cultivator** one year, $1.25.

How to Grow Chicks, by T. F. McGraw, 25 cents. With **Cultivator** one year, $1.00.

Reliable Poultry Remedies, 25 cents. With **Cultivator** one year, $1.00.

CHANGE OF ADDRESS.—In notifying this office of change of mailing address, please bear in mind that the old postoffice address must be given, as well as the new. Our records are such that it is almost impossible to find a name on our lists unless this information is given.

Agricultural Notes of the Pacific Coast

Northern California

Harvesting is in full swing at Gridley.

Sutter county apple crop will be heavy.

State farmers institutes will be held October 8th, 9th and 10th at Davis.

The crop of hops in the Bear River section indicates a big output this fall.

Some orchards of Sacramento valley were recently injured by severe wind storm.

People of Capay valley in Yolo county are planning for a harvest festival July 29th.

An election of trustees of Drainage District No. 1 of Butte county will be held July 13th.

The soil survey which was discontinued in the Sacramento valley has again been resumed.

G. A. Murphy of the Sunnyside Stock Farm, Perkins, Sacramento county, makes a shipment of his fine Berkshires to Honolulu this month.

A special train carrying railway officials and managers of fruit interests recently visited Stockton looking after fruit prospects.

The biggest output of green deciduous fruit ever shipped out of the State is the prediction. Fifteen thousand cars are estimated.

Stock cattle in Tehama county are now commanding one-half cent more than stock ready for the butcher. This is said to be a condition not prevailing before for years.

It is reported that at the coming October State farmers' institute at Davis the question of the separation of the Agricultural College and the State University will be discussed.

The Pacific Fruit Cooling Company of San Francisco is installing a precooling plant at Newcastle. It will cost about $15,000. Other plants will be erected in the near future.

Suisun and Green valley fruit growers are having trouble on the labor question. An effort has been made to fix upon a scale of wages so as not to be held up by the labor combination.

The effort to bring the Petaluma Keepers' Association and the Santa Rosa Poultry Keepers' Asociation under one organization, has not yet succeeded, though the two organizations are affiliating.

The recent creamery pay day at Ferndale brought out the following figures for June delivery: Capital, 25 1-4 cents; Central, 26; Eel River, 25; Cream City, 26; Grizzley Bluff, 25; Pioneer, 25; Riverside, 25.

The wine grape growers of the Barry district recently perfected an organization which will look after the interests of the members. It will dispose of its crop, ascertain market conditions, and solicit bids. They hope to receive $15 per ton this year.

A lawsuit of long standing was recently decided in San Francisco in favor of a grain grower who sold in 1900 21,000 sacks of grain to the McNears, but after the grain had been delivered on platform at shipping point it was seriously damaged by rain. The purchasers refused to take it, hence the suit which is now favorable to the grower.

Central California

The Lodi yield of Tokays from present indications will be good.

Some of Lodi's Tokay grapes were shipped last year to Tampa, Florida.

Thompson seedless grapes will be a fair crop in Fresno county this year.

The Russian thistle is more abundant this year than for several years.

The dried fruit market, especially that of prunes, remains decidedly flat.

Raisin producers are hoping for about three-cent basis on the coming crop.

First deliveries of apricots at Sanger, Fresno county, were about July fourth.

Three immense grass fires occurred in the neighborhood of Bakersfield on July fourth.

A few prune orchards of Santa Clara valley have been damaged by leaf folding caterpillars.

Grape growers about Santa Cruz report a light crop or at best an average for this season.

Armsby & Company are buying some of the 1907 hold over raisins at a price of 2 1-4 cents.

Santa Clara pack of cherries is about finished and apricots are filling the packing houses.

The better varieties of plums have sold over the San Joaquin valley at from $40.00 to $50.00 per ton.

Mountain View, Santa Clara county, reports prunes as showing up much better than was anticipated earlier.

The Lodi Chamber of Commerce participated in its first annual meeting and banquet to the growers and packers of grapes in that district.

The people of Exeter have secured the use of a large car barn for holding the coming Tulare County Citrus Fair, which will be held at Exeter in December.

At the recent orange growers' meeting at Lindsay it was decided that hereafter oranges should be picked by labor by the day rather than by contract work.

The Tulare County Grange is endeavoring to work up interest in the establishing of a county park. A parcel of fine land of about 100 acres has been selected.

The Spreckles Sugar Company has issued instructions to their employes to locate in the town of Spreckles, which has caused the Salinas people much uneasiness.

Fruit buyers at Fresno assure the fruit men of that section that there will be abundance of capital to handle the coming fruit crop. Large quantities of Eastern money have been brought here for this purpose.

County Entomologist Morris of Santa Clara county reports extensive investigation as to pear thrips, and that while individuals are comparatively easily killed by spray the increase is so rapid that they are very difficult to handle.

The wine manufacturers and producers of California recently held a meeting to consider ways and means to protect the wine and grape industry of California. A meeting at which it is hoped all wine growers of the State will be present, is called for Wednesday, July 22, at San Francisco.

Southern California

Ventura county bean farmers are in the midst of an irrigation campaign.

A Riverside rancher has secured 20 sacks of oats per acre this season.

Orange county apricot cutters began work on the Monday following the Fourth.

Bee inspector Pleasants, of Orange county, is busy these days inspecting apiaries for foul brood.

The Gold Buckle Fruit Association of Highlands closes its orange season with a banquet and social evening.

Farmers near Las Posas, Ventura county, are irrigating this year, a new supply of water having been secured.

One fruit company at Colton will handle 1200 tons of apricots. The highest price has been about $15 per ton.

One man has made an experiment with peanuts in Imperial valley, planting forty-five acres to the small Spanish variety.

Apiaries of Orange county will produce a good flow of honey this season which is of fine flavor, but reported rather darker than usual.

The Gregory Fruit Company at Colton is running full time on apricots and as soon as possible will take up the canning of peaches.

The expectation was that Gifford Pinchot of the Forestry Service would be in Southern California by this time, but owing to ill health his trip is deferred until October.

More than twenty-five square miles of brush and timber land were burned in Willow Canyon near Redlands, San Bernardino county, last week. Over 300 men turned out to fight the fire.

The Walnut Growers' Association of Southern California held an important meeting in Los Angeles last week, the principal discussion being on the subject of protection for walnut industry.

The Union Sugar Company opened its 1908 campaign last week at Santa Maria, Santa Barbara county. The Santa Maria Times claims that some beets will run as high as 25 per cent sugar.

Eight hundred more date palm slips are on their way from Algiers and will be planted near Indio. They were secured in Africa by Bernard G. Johnson, who has made several trips to Algiers for similar importations.

The fruit investigation heretofore carried on by G. Harold Powell and his corps of assistants has resulted in such great benefit to the orange industry that an early investigation of the causes of lemon rot and of the losses in shipment will be taken up.

The lima bean situation of Ventura county is in better condition at this season of the year than it has been for several years. Old stock is almost all cleaned up and the acreage for new crop larger than last year. The crop is reported exceedingly promising.

The decision of Judge Welborn in the water rate case gives assurance to water users of the Imperial valley that they will not be compelled to pay unjust water tax. On the other hand, it is claimed the affairs of the California Development Company are in a somewhat muddled state as a result of the decision.

The Coast

Milton, Oregon, is harvesting its grain.

Rain is badly needed in Eastern Washington.

Crops at Grover, Colorado, were recently damaged by hail.

Hay harvest at Walla Walla, Washington, is practically finished.

Cove, Oregon, is busily engaged shipping 200 tons of cherries.

Coeur D'Alene will have an immense crop of very fine fruit this season.

The Palouse Washington creamery now has 103 patrons on its pay list.

Lewiston county, Idaho, will harvest ten million bushels of grain this season.

Farmers of Eastern Oregon are many of them riding to town in automobiles.

Ewartsville Grange held a live stock show near Pullman, Washington, last week.

Pendleton, Oregon, has shipped during the last twelve months 412 carloads of live stock.

Vines at Lewiston, Idaho, are full of young fruit and a heavy crop of grapes is promised.

Yellowstone county Fruit Growers' Association has just been organized at Billings, Montana.

Fall wheat never looked better than it does at the present in Palouse county, Washington.

Production of grain at Walla Walla, it is thought now, will fall 25 per cent short of normal years.

The midsummer fair held at Davenport, Washington, is proving a success, with a good stock display.

Riddles, Oregon, Fruit Growers' Association has been organized to look after the interests of its members.

Milton, Oregon, cherry crop will be a record breaker and owners are concerned as to labor supply to handle it.

Midsummer meeting of the State Horticultural Society of Oregon, will be held at Dalles the end of this month.

Lewiston, Idaho, fruit growers have been swamped under such an immense crop that they were unable to get sufficient labor to properly harvest it.

The reserve supervisor of Bitterroot National Forest, Idaho, has enlisted students of Idaho University as forest rangers during the summer vacation.

Reclamation Service engineers are investigating as to the feasibility of irrigating a tract of land of about 15,000 acres near Glenwood Springs, Colorado.

A woman at La Grande, Oregon, stood in line 36 hours in order to file a homestead on land thrown open to entry in Blue Mountain National Forest Reserve.

Machinery for the immense packing plant of the Union Meat Company at Portland, Oregon, is on the way from the East, and one of the finest packing houses in the land is promised.

A tour of the wheat growing sections of Eastern Washington shows that the crop will be exceedingly spotted, running from the biggest crop ever in some sections to an almost complete failure in others.

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Coulson's Cresolene

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company
Petaluma, California
Germain Seed Co., Los Angeles, Distributing Agents for So. Cal.

Little Chicks should be fed on **Excelsior Chick Food**

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

Excelsior Cereal Milling Company

242 Central Ave., Los Angeles

Black Langshans Well, we won again at Los Angeles. Two firsts, one second, one third on five birds shown. Best stock ever in show room in California. Eggs, $2.00 to $5.00 per 13, $10.00 to $20.00 per 100.

White Rocks Large and vigorous. Improve your stock with a setting or get a fine flock with an incubator lot. Eggs, $1.50 to $2.50 per 13, $8.00 to $12.00 per 100.

S. C. White Leghorns Order eggs now, we have plenty of them. Have had all winter, great big white ones. Eggs, $1.00 to $2.00 per 13, $6.00 to $10.00 per 100.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

KAFFIR CORN AS POULTRY FOOD.

KAFFIR corn has characteristics to recommend it as a poultry food. A native of South Africa it has adapted itself to climatic conditions similar to those existing in California. Its drouth resisting qualities recommend it especially to those living in localities too dry for the best development of corn. It will produce a crop on less rain than is required for corn, and is not affected so disastrously by hot winds.

Kaffir corn yields best on rich lands and responds to generous treatment, but its culture is not limited to soils of certain classes and qualities. It may be grown on a variety of soils as adobe, light sands and poor uplands. When corn has once been stunted by drouth or hot winds it never recovers. Not so with Kaffir corn. It may remain stationary and curled for days and revive if it gets moisture.

Yield of Kaffir Corn.

The yield, of course, varies with the character of soil and the season. The Kansas Station found as a result of several years' investigations that the red variety invariably out-yielded both White Kaffir corn and Indian corn.

The average yield per acre of these three at the Kansas Station for four successive years was as follows:

	Grain Bushels	Fodder Tons
Red Kaffir corn	58.25	6.05
White Kaffir corn	32.55	5.33
Indian corn	45.50	3.07

Composition of Kaffir Corn.

The analysis shows that Kaffir corn compares favorably with corn in the amount of nutriment it contains as illustrated by the fact that Kaffir corn contains 9.927 per cent of protein; 74.92 carbohydrates and 2.97 of fat, while Indian corn contains 10.50 per cent of protein, 69.60 of carbohydrates and 5.40 of fat.

The most marked difference occurs in the relative per cent of fat in the two, Indian corn being much richer in this constituent than Kaffir corn.

In using this grain as poultry food it is not necessary to thrash it but the heads may be dried and fed without thrashing. Kaffir corn should be fed with some substance rich in protein as bran, coocanut oil meal, oil cake meal, etc., as it runs low in this substance and also in fat. It lends itself readily to combinations with cocoanut oil meal, a substance rich in protein and fat.

To those poultrymen living in the interior valleys and on irrigated lands Kaffir corn offers a valuable addition to the list of poultry foods that may be grown.—S. S. T.

POULTRY BREVITIES.

Bone fed in some form is necessary in egg production.

Feather pulling is a vice caused by overcrowding and idleness.

Whoever undertakes to raise late chickens must expect to fight lice.

The food is responsible for the health, growth and flesh of poultry.

Where alfalfa can be easily grown, give the hens a generous supply, as it is the cheapest source of protein material to be obtained in California.

Most chicken coops are too close, too heavy and too inconvenient to clean.

Poultrymen can greatly lessen their work by having large runs or yards and many of them.

Movable chicken houses are useful if so built that they will not come to pieces when moved.

More young chicks die from overfeeding and sour fermenting food than from any other cause.

The floors, roosts and nests of chicken houses should be easily removable for cleaning and disinfection.

It does not necessarily harm hens to feed them improperly balanced rations, but it is a decided waste of food. Wasted food is wasted money.

The disinfection of a house or cleaning out of mites or lice is much more easily accomplished and the work more thoroughly done, if the house can be quickly and easily moved.

The placing of 20 to 40 chickens in a small yard (say 50x100 feet) and keeping them there from 8 to 12 months in a year, is one of the means of intensifying the propagation of intestinal parasites of all kinds.

A large area as a yard or pen will not become infested with intestinal worms or other parasite as quickly as a small area.

The fewer the birds and the shorter the time the birds are kept in a given place the less danger of infestation.

The above often explains why small flocks with wide range are apt to maintain health and vigor much better than large flocks closely yarded.

Roup.

Kindly give a remedy for roup. A friend tells of a cure in liquid form. About a quart was put in the chicken coop and the chickens then shut up in the coop so they were forced to inhale it. Can you tell me what it is? —S. S., Hollywood.

Kerosene oil is highly recommended as a roup cure. A thin film is formed on a disk of water, the head of the affected bird is dipped into it and held there for an instant then removed and wiped dry. Kerosene oil may be injected into the nostrils and the sick birds fed on corn soaked in kerosene oil. Potassium permanganate may be used in the drinking water enough to color the same a pink color.

Birds that have once suffered from roup fail to develop satisfactorily and are often stunted, worthless specimens, and I have found the cheapest treatment to be the destruction of all badly affected cases and disinfection of houses.

Don't have roup. Prevent it. It is a contagious disease and efforts should be directed to keeping it out by keeping quarters clean, birds in a healthy, vigorous condition and adopting the rule that no new birds shall be introduced into a flock until convinced that they are free from dis-

ease. I am not familiar with any remedy the fumes of which will cure roup.—S. S. T.

Balanced Food.

I have taken the Cultivator a good many years and like it very much. I am interested in poultry and appreciate your article on balanced feed in a recent issue. I wish you would give us more of it. Would like to know the "balance" when Egyptian corn and cocoanut meal are used. What you gave was for hens; how would it be for pullets? I am trying the dry feed on 900 pullets.—G. W. P., Hollister, Cal.

I am pleased that readers of the Cultivator are taking interest in the scientific feeding of poultry, as I look on it as one of the important factors on which the economical production of eggs and meat depends.

A combination somewhat as follows of Egyptian corn and cocoanut oil meal will give a fairly well balanced ration and satisfactory results:

		Protein	Carbo-hydrate	Fat
7 lbs.	Cocoa oil meal	1.15	2.97	0.70
15 lbs.	Egyptian corn	1.245	9.63	.45
1½ lbs.	Beef scrap	.81	0.035	.045
		3.205	12.635	1.195

This mixture yields a nutritive ratio of 1-4.75, i.e., every pound of nitrogenous material is combined with 4.75 pounds of starchy material and fat. Experience has shown that such a relative proportion gives satisfactory results. I have added the meat scrap to this ration because it has been amply demonstrated that better results follow in way of egg production when part of the protein of a ration comes from meat.

Skim milk may be substituted for the meat, but with less satisfactory results, is the general experience of poultrymen. Skim milk is a valuable poultry food.

Seven pounds of cocoa nut oil meal, fifteen pounds of Egyptian corn and five pounds of wheat bran will make a hopper mixture that will conform somewhat closely to requirement. Feeding standards simply serve as guides to correct feeding and must be modified for different localities.

Where foods rich in protein are abundant and cheap it is sometimes profitable to feed a narrow ration; i.e., one rich in protein. When such substances are costly we may find it advisable to make the ration wider, i.e., rich in starch; in either case we waste a certain amount of food, but owing to the condition of the market may justify the waste. Make the basis of the ration the material easily and cheaply obtained and balance this with the more costly substances.

In developing pullets feed a ration rich in nitrogenous material, and in mineral matter; bone, flour, etc., are good material to supply mineral substances for young birds, and the addition of bran will be advisable.

In addition to the ration outlined above, the hens should be supplied with plenty of green food and mineral matter.—S. S. T.

THE VALUE OF HEN MANURE.

Hen manure of good quality is richer in plant food than ordinary barnyard manure, and where any considerable number of hens are kept in connection with an orchard, the value derived from the fertilizer adds materially to the profits from the flock. A five-pound hen will produce in a year about ninety pounds of manure, this at $7.50 per ton, which is a fair valuation, giving twenty-nine cents for the manure per hen per year, or twenty-nine dollars on a hundred. This is a strong argument in favor of hens in the orchard.—S. S. T.

A TALK ON GEESE.

Goose breeding in this country is not so extensive a branch of industry as is the breeding of turkeys. Why this is so I do not understand. Geese are more easily reared and cheaply fed than any other fowl; being grazers, they will grow to full size on grass alone.

They can be fattened for market in a very few days. I never feed longer than twelve or fourteen days before marketing.

Our flock of 200 goslings this season, when dressed and ready for market, ranged from twelve to fourteen pounds apiece.

Geese are very intelligent and can be taught to do your bidding with very little trouble.

They are easilly fenced in. A little brush laid along under the pasture fence will keep them where they belong.

Geese are water fowls, and it is quite essential that there should be a small pond or stream of water in their pasture.

To insure safety from pollywog poisoning, give salted water every morning before going to pasture.

I have fattened geese almost entirely on raw apples and raw turnips, cut fine, and this is a very good plan when grain is high-priced or scarce.—Farm Journal.

The sex of the future chicks cannot be distinguished by examination of the eggs. Round eggs, pointed eggs, and other-called indications, have been tested hundreds of times, not only by experimenters, but also by poultrymen and farmers, the result being that nothing is known in advance of hatching, so far as the sex is concerned. Mating birds of different ages has also been a subject of experiment in controlling the sex, but no satisfactory results have been obtained. Eggs for hatching should be kept on racks in a cool place, and turned half round three times a week until used under the hen. They should hatch even if kept a month.—American Stock Keeper.

There is a limit to the profit-earning of a chicken, and it must be sold when that limit is reached or before. Unless a bird is growing into money, or laying eggs, or hatching chickens, it is a dead expense. Just about this time is the time to clean up and get rid of everything that is not needed for next season's breeding. We have written of this matter before but all mortals are so prone to forget or to postpone duties that ought to be performed at once, that we will be pardoned for reiterating the advice.

Clipping off the flight feathers of a wing to prevent a fowl from flying over a fence causes it to look misshaped or one-sided. There is no necessity for cutting off the feathers. The object can be attained by cutting off the inner web of four or five of the long flight feathers, so they can not hold against the air and the wing will retain its place, and the outside of the same will not be disfigured. Do not destroy the wing by clipping it after the molting season on such fowls as are intended for selling or showing.

Lettuce is an excellent food for young geese and ducks. Usually there is more in the garden than the family uses. This can be fed with profit. It pays to raise it for young waterfowl, and all kinds of poultry like it.

FEED YOUR PULLETS

As well as your Laying Hens, on

Coulson's Egg Food

It will bring them to maturity in health and vigor and ensure you lots of eggs in the Fall when prices are high. It can be fed moistened as a mash, or dry in hoppers. Manufactured only by

Satisfaction Guaranteed
C. E. Bunker
San Jacinto, Cal.

Two things cause expense in the poultry business. The first is loss or waste; the second feed. Prevent waste and make a pound of feed produce the greatest possible gains and you have solved the mystery of profits in the poultry business. Cleanliness is more than half the battle in preventing loss. Keep the lots, the yards, and the houses as clean as you can and you will find that the losses of last year will be reduced fifty per cent.

Small Fruits and Vegetables

SOILS FOR GARDEN CROPS.

For peas and beans a light, loose soil, well-prepared, but not necessarily a very rich soil, is needed. The application of well-rotted manure may be made the year before or the fall before, but care should be taken not to apply too much fresh manure, as it promotes too much growth of foliage at the expense of pods. The principal thing in raising peas or beans is to get the ground in a mellow condition and keep it in that condition by cultivation.

Lettuce, too, requires a mellow soil rather than a rich one. This plant, however, will stand a richer soil than peas or beans. Since its value as a food lies in its growth of foliage, fresh manure may be applied to the bed with good results the spring or fall before it is planted to lettuce. Care should be taken not to apply too much, as too rank a growth may effect the flavor and tenderness of the leaves.

Radishes require a rich, deep soil, quite mellow and reasonably rich in potash. The application of well-rotted manure of wood ashes at the rate of two tons per acre is advised by many successful gardeners.

SQUASHES FOR HOME GARDENS.

A great advantage of the squash is that a few hills will produce enough for the average famliy. Therefore, they can be planted in some spot tnat would remain unused otherwise. Or they can be grown among tbe corn.

The summer varieties are mostly bush forms. The running squashes are late and long-keeping kinds. The soil should be as rich as possible, that their growth may be hurried, as they should blossom before mid-summer to be at their best. Compost is better than much manure, which makes the plants run to vine.

Give each hill of the bush variety a clear space of four feet and a clear space of seven feet to each hill of the running kinds. Put 10 to 12 seeds into each hill, planting about an inch deep.

As squashes are great sufferers from striped cucumber beetles in their early stages, it is best not to thin the plants till the danger from these pests is over. When the squashes have attained sound growth and it is clear which ones are the best, thin down to three plants in a hill.

Do not allow the running varieties to root at the joints, for the stems will be almost sure to try to make new root, which will prevent them from making fruit. If the plants run too much to vine after flowering, pinch them back so that the surplus strength shall go into the fruit.

If one fruit sets much earlier than the rest, it is generally best to take it off, as that will make the rest of the crop more uniform.

PEPPERS.

Peppers are another vegetable that has not yet found a place acording to its merits in the average farmer's garden. They are easily grown in any ordinary good garden soil. Fifty years ago the tomato was hardly thought of as a vegetable fit to eat. But its use has now become wellnigh universal. In fact, of all culinary vegetables it is now considered one of the least dispensabie. Everybody wants tomatoes. Everybody likes them. Peppers up to a few years ago were used sparingly as a condiment. With the introduction of the newer large varieties has come a demand and a use for them that was not thought of before. Our large foreign population, especially of the Latin races, consumes large quantities of peppers, even of the older and more pungent sorts. But the use of peppers as a table vegetable or relish in the way that green onions or radishes are eaten is steadily on the increase, and even now has reached large proportions. The new large varieties are so mild that they can be eaten almost like an apple or a tomato without causing any "smarty" sensation whatever.

IMPERIAL VALLEY CANTALOUPES.

We must have peppers in the home garden. The good woman wants some in the late summer or early fall for mixing in her various compounds known as chow-chows, picallillies, etc.; and for these purposes she may want both the hot and the mild kinds Long red cayenne leads among the hot kinds. It is conical in shape, three or four inches long. Among the small, pungent kinds, most of which make a very ornamental plant besides, we have Tabasco, Red Cluster and Coral Gem Bouquet. Ruby King is an old standard mild pepper, red in color. Other mild red sorts are Large Bell or Bullnose, Sweet Spanish, Sweet Mountain, Spanish Monstrous and the long Procopp's Giant. Among mild yellow sorts all very handsome, too, we have Golden Queen, Golden Dawn and Golden Upright. Elephant's Trunk is a very long, bright scarlet sort, rather irregular, and, therefore, not particularly popular.

Kesosene emulsion will kill vine borers in the squashes. In order to start new roots, cover the joints of the squashes with fresh soil.

The Ornamental Garden

BEAUTIFY THE YARDS.

Flowers are not only beautiful to look upon, but their influence is wholly refining, the cost of a few seeds is trifling and the labor involved becomes not labor but a keen and health-giving pleasure. There is no good excuse why every householder with a yard should not beautify it, not necessarily with costly flowers like orchids and some others, but according to his means, if with but a few violets, pinks, geraniums and nasturtiums. A town is judged by strangers by the appearance it presents. If, in passing through the predominating streets he notes dirty alleys, heaps of refuse and tin cans and ill-kept yards, he judges the town and its people accordingly. If on the other hand, he finds cleanliness, nicely kept lawns and gardens gay with flowers he is impressed with it as a prosperous, inviting town, peopled by wideawake, progressive cultured inhabitants. Impressions count for a great deal.

The same applies to the home ranch. It reveals the character of the owners. Go out and walk past your own home and read your own character. Does it look good to you?

CHRYSANTHEMUMS.

Chrysanthemums grown for exhibition blooms should not receive liquid manure after the flowers begin to expand their petals. The application after that time would not be likely to benefit the flowers, and would undoubtedly have a tendency to promote "damping" of the petals. Raising chrysanthemums from seeds is a favorite phase of gardening with many cultivators, amateur and professional. Seeds may be purchased at times, but generally the results are disappointing unless some special "strain" specially selected can be procured. It is in the power of most gardeners to save seeds from fine varieties that will be likely to produce something of value. The plants likely to produce seeds are not those specially grown for exhibition, but those grown for border decoration. A little thinning of the terminal bunch of buds is advisable, and cross fertilizing with other kinds can be easily accomplished. The disc or "center" should be showing in the flowers otherwise seed will not be available. The usual plan adapted by growers of seedlings is to grow a few plants of special varieties together for seed purposes. The petals of the flowers are cut off with scissors, and as the pollen ripens it is transferred to other plants to assist in the fertilization and also to cross the varieties. The seed ripens about December or January and should be cleaned and reserved for sowing until spring.

THE LILY-OF-THE-VALLEY.

The lily-of-the-valley is a very easy flower to grow, being, when once a good bed of it is established, almost able to take care of itself. The way to start a bed is to procure early in the spring a few sods—say a piece a foot square, cut out deeply and carefully with a spade. Having removed from the mass all the grass roots, these sods should be set out in a rich mellow soil, from one to two feet apart, in a partially shady place. If no weeds are allowed to invade this plot, the lilies will spread rapidly and soon result, by filling up the vacant spaces, in a fine bed of them.

Truth to tell, if kept well watered, they will produce blossoms the same season without seeming to notice the change of situation, while the original beds, if the holes where the sods came out are only filled up with rich dirt or dressing, do just as well if not better than before. All the attention that the bed needs after that is to keep the grass out of it and give it an occasional top dressing of manure in the fall.

BULBS AFTER FLOWERING.

The custom of having flower beds occupied the whole year through, first with flowering plants and then with bulbs, is now almost universal. Many beds are often started early with pansies, followed later by the various bedding plants now in use. Later the beds are re-made and are filled with bulbs, so that they are filled the whole year through. Bulbs can be had at such a low price and are so beautiful when in flower, that their use seems to be more popular every year. They may be set there at once on being dug up from the beds, preserving the tops unless they are ripened and dead, as the tops, so long as green, help toward perfecting the bulbs for further flowering the season to come. When the bulbs are ripe, which the dead tops indicate, they need not be planted at once unless desired, but may be spread out to dry for a day or two, tops and all, then the tops cut off and the bulbs kept in a dry closet until fall and then be planted.

TO DESTROY DANDELIONS.

Use two pounds of sulphate of iron to one gallon of water. Sometimes one-half ounce of sulphuric acid is added. The solution is sprayed over the dandelions and grass. The former is killed but the grass is left uninjured.

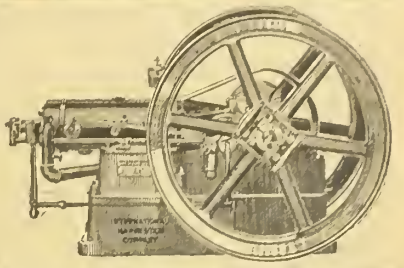
To exterminate ants from the garden or the house when they become a nuisance, round out the earth about the mouth of the ant hill; pour into this some bisulphid of carbon—say a tablespoonful will be sufficient—lay a brick over the hole, and cover it with dirt. This will exterminate the ants in that nest. The same preparation can be poured into rat holes, the homes of gophers or any kind of vermin which is injurious to the welfare of your country place. Use this with care, as it would poison human beings as well as animals if they drank it.

Roses should be picked as freely as possible with as long stems as the growth will permit, merely leaving an outward growing eye or two for safety on the stem below the cut. Where all blooms cannot be picked, the plant should be gone over daily and all faded flowers removed to a point at least two eyes below the flower. This is the only means of assuring later bloom from "hybrid perpetuals."

An effective emulsion for destroying the plant lice found on sweet peas, golden glow, etc., is made by dissolving a five-cent cake of Ivory soap in 6 or 7 gallons of hot water.

The striped bug on melons can be kept in check by using air slaked lime freely. This does not injure vines and should be used in time, as irreparable damage is often done in a very short time.

The GREAT AMERICAN DESERT is DISAPPEARING



THE great ranges are fast being taken up by individual settlers, and thousands of prosperous farmers are taking the place of the few cattle kings that were monarchs of the ranges a score of years ago.

It is the story of the magic touch of water upon the dry land.

I. H. C. Gasoline Engines in Irrigation Enterprises.

If you have not kept yourself posted on irrigating matters, you will be surprised at the important part I. H. C. gasoline engines are taking in the reclamation of these waste lands.

Hundreds of settlers and farmers have no other means of getting water upon their lands than these engines.

These settlers and farmers are cultivating all sizes of farms, from garden spots to "forties" and "eighties" and quarter sections and even larger tracts. They are among the most prosperous farmers in the irrigated sections. They are raising grains, alfalfa and other grasses—vegetables, fruits, etc.

They find that with an I. H. C. engine they can get water in large quantities upon their land, and that they can get it dependably and economically. They find the I. H. C. engine method of pumping more direct, more profitable and more satisfactory than any other means heretofore employed.

I. H. C. gasoline engines are simple, dependable and powerful. They pump water economically, and you will find that they run with very little attention.

If you have an irrigation problem it will pay you to investigate and see what an I. H. C. gasoline engine will do for you.

Vertical engines in 2 and 3-Horse Power.

Horizontal engines (Portable and Stationary) in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Also, gasoline traction engines, pumping, sawing and spraying outfits.

Call on the International local agent, or write the nearest branch house for catalog and colored hanger.

Before You Build or Repair
Send for Samples and Prices of
J-M ASBESTOS ROOFING

You know what Asbestos is—the indestructible, fireproof mineral—that wonderful non-conductor of heat and cold. Then think what a roof of this means to a building. Protection against fire; protection from heat in summer and cold in winter; absolute protection from all weathers, lasting as long as the building itself, and yet

IT NEEDS NO PAINTING OR COATING

Isn't that the kind of roofing you want? It certainly is the "cheapest-per-year" roofing made. We warrant it absolutely, and the price is right. It comes all ready to lay. Nails and cement included. *All you need is a hammer.*

Write today for Free Book No. 41

We'll send samples and prices also. You'll get helpful hints from the book, whether you buy roofing or not. Ask for it. We want you to have it anyway.

H. W. JOHNS-MANVILLE CO.,

203 East 5th Street *Los Angeles, Cal.*

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Potatoes Planted "In the Moon."

In replying to a query regarding planting of potatoes, Mr. Lobingier showed his lack of faith in the influence of the moon on vegetation. This has occasioned the following reply from Mr. E. A. Beard of Anaheim:

I noticed in your reply to the question in the July 2nd Cultivator, that you denounced belief in the influence of the moon as having an effect upon crops. While I am not a believer in many superstitious sayings, such as throwing a stone over your head and a wart will disappear, or kissing a mole off of a fair maiden's cheek, I have observed that vegetation makes a more thrifty growth in the first part of the new moon than it does in the dark of the moon and am of the opinion that crops such as potatoes, peanuts, etc., should be planted in the dark or decrease of the moon and alfalfa, corn, etc., should be planted in the light of the moon or about new moon. Has any one else an idea?

Onions on Heavy Land.

Will you kindly inform me whether red, heavy land, that sub-irrigates, and is very moist the year around will raise Bermuda onions to a success. If so, will it be best to fertilize and how?—E. W. L., Sultana.

Generally speaking, heavy land of any kind is not considered ideal for onions. The fact that this soil is moist may make an exception in the case. It is always best to fertilize for onions if you want a good yield. Well rotted stable manure is always safe, but you cannot always get it. Manure from the cow corral, which is usually tramped up very fine, thus enabling you to thoroughly mix it with the soil is also good. Pure ground bone is a good fertilizer for almost every crop. Use from 800 to 1200 pounds per acre—well cultivated into the soil before planting.—Q. A. L.

Pruning Tomatoes.

Please tell me how and when to trim up Earliana tomatoes for fall and winter crop. They are just getting ripe now.—R. E. S., Riverside.

I have never practiced that method of getting fall and winter tomatoes, but have been successful by sowing the seed the latter part of July and even as late as August 1st, and growing precisely as for the early season's crop. If I were to try to bring in a late crop from old plants I should cut back the old plants freely about August 10th and depend on the new growth to produce the fruit. Do not water too freely until the new growth starts.—Q. A. L.

Fertilization of Tomatoes.

Please tell me what to put on tomato plants to obtain best results?—Mrs. J. P. W., Palms.

Generally speaking, nothing is better than stable manure. To answer this question satisfactorily, I ought to know something of the character of the soil. Pure ground bone is a good commercial fertilizer, applied at the rate of 500 per cent or 600 pounds per acre. The most wonderful results I ever saw in tomato growing were obtained by a Scotchman who worked in the Dunbar Iron Works among the mountains of Pennsylvania. He planted the tomatoes 18 inches each way and trained them to a single stock tied to stakes and after they were about a foot high he covered the ground six inches deep with fresh stable manure. But he was an accomplished gardener as well as ironworker.—Q. A. L.

Onion Sets.

Please inform me through the Cultivator how onion sets are obtained. Also onion seed and oblige.—A Subscriber.

Onion sets are obtained by sowing the seed very thickly which prevents their development into full grown onions. It is a business requiring experience and skill and in California, especially the selection of suitable soil. No inexperienced person should attempt the work in a commercial way as the chances for failure are 100 to 1. And for a few sets for the home garden, unless one grows them for the pleasure in the work, it is cheaper to buy at the seed store.

Onion seed is produced by planting well ripened, selected onions and giving them special care. As a business it is even more exacting in its requirements than growing the sets. There is no royal road in growing good onion seed, and it is because it requires a special brand of honesty on the part of the grower as well as experience and ideal conditions that good onion seed is never sold at low figures.—Q. A. L.

Dry Land Pasture.

I have a farm in the Sulphur Spring valley, Arizona, but I have no water on the place for irrigation. Although it is good land of a sandy loam, it makes very poor pasture for lack of moisture. I would like to ask your advice as to what kind of shade trees I should plant. I could give them a little water at the start. What would make the most rapid growing hedge? Is there any kind of grass I could sow to increase the pasture? I don't know the name of the grass that grows on the land.—A Subscriber.

A grass for such conditions is hard to find. Paspalum has been recommended, but tests show it to be far from perfect. Salt bush is often used and with fair results .

We do not know your winter temperature, but think the red gum or Eucalyptus rostrata would answer for the trees.

Air Pump.

Can you tell me anything about the air pump and where it can be procured?—W. M. D., Corning.

We do not know exactly what is meant by air pump, but assume that the air-compresser water lift is meant. Almost any irrigation machinery dealer advertising in the Cultivator can supply information regarding these pumps or "air lifts."

Old 'Cots.

I have four large apricot trees, (say 15 years old) in my back yard, which have not borne a hat full of fruit for the last four years. They used to bear abundantly. I take the same care of them now as then, only better. They are vigorous and healthy. What is the matter with them? Can I put new business life into them or have they got too old to be useful any more?—W. H.

Cut the trees back at once two-thirds so as to retain their symmetry at the top and allow sufficient to remain to make good tops. This is the best treatment for trees of this kind and by adding abundant stable manure they will also be benefited.

Sometimes severe summer pruning will stimulate trees to throw out vigorous fruit buds, thus giving a heavier crop the succeeding summer. These trees being so old probably need this stimulus.

Squash Bugs.

Please give remedy for destroying pumpkin bugs, or the striped green bugs which destroy pumpkin and other vines.—W. L. H., Fowler.

As will be noted in Mr. Isaac's department this week, this is a most perplexing pest to handle. Hand-picking is suggested as the remedy, but in a large field this, of course, would be impossible. Paris-green poisoning, while not satisfactory, is perhaps the best remedy. The most practical way of protecting vines where it can be done is to stretch over them frames covered with netting.

Flavored Milk.

I have a cow four years old with second calf. She is in good condition, in a clean place. Her milk tastes old after it stands a few hours, also the butter. Have changed feed and am now feeding clean alfalfa together with oat and barley hay, some potatoes, bran and alfalfa meal, and still the milk tastes.—Subscriber, Santa Clara.

We feel sure the cause of your trouble is not in the feed or in the condition of the cow, especially as you do not mention that the milk has a bad flavor when first drawn. We think the trouble comes from bacteria developed in the milk after being drawn. To destroy this, give a very thorough scalding, or better, a steaming of all utensils used for the milk. Any crevice or place where the bacteria may be allowed to lodge should be given such a temperature as to destroy all life. We believe this will correct your trouble, although if the cow has range in the pasture it is barely possible mustard or some other weed may be the cause of tainting the milk.

Wax for Floors.

Will you kndly give formula for mixing wax for waxing floors and furniture?—E. S., Fullerton.

Potash, 1 part.
Water, 4 parts.
Yellow beeswax, 5 parts.
Hot water, a sufficient quantity.

Emulsify the wax by boiling it in the water in which the potash has been dissolved; stir the whole time. The exact amount of boiling is determined by the absence of any free water in the mass. Then remove the vessel from the fire, and gently pour in a little boiling water, and stir the mixture carefully. If a fat-like mass appears without traces of watery particles, one may know the mass is in a fit condition to be liquefied by the addition of more hot water without the water separating. Then put in the water to the extent of 200 to 225 parts, and reheat the compound for five to ten minutes, without allowing it to reach the boiling point. Stir constantly uutil the mixture is cool, so as to prevent the separation of the wax, when a cream-like mass results which gives a quick and brilliant polish on woodwork, if applied in the usual way, on a piece of flannel rag, and polished by rubbing with another piece of flannel.

We would also refer the inquirer to the paint stores which keep this ready-made and probably far cheaper than one could mix for any small quantity. In other words, it would be like manufacturing varnish, when it can be bought so much more satisfactorily. At least the writer recently bought for 45 cents a small can which was sufficient to go over a stairway and is still in the house to use on furniture whenever needed. This is the common floor wax.

Pruning Raspberries.

Should we cut back the new shoots on our red and black raspberries now?—E. M. S., Reedley.

Yes This will cause them to throw out side branches which can be shortened back in the fall. This method will give larger and more fruit.—T. A. L.

Fullers Rose Beetles.

Responding to a recent query, Mr. S. A. Pease of San Bernardino writes:

"If the Fullers rose beetles are working under ground on strawberries or raspberries, the treatment is carbon-bisulfid, a small quantity poured in holes made with a picket pin or similar instrument 14 inches apart and same distance away from the roots.

Alfalfa For Pigs.

If any of your subscribers have had experience in raising hogs on alfalfa pasture, I shall be pleased to hear from them through the columns of the Cultivator, giving their experience and the results.

In this connection I wish to know the number of pigs that can be carried per acre from time of weaning, say for six months, and what would be their weight at that time provided they were hardened up for three weeks by a grain ration, and what would be that ration?

I am taking it for granted that the alfalfa would be well set and that the pigs would be supplied with an abundance of pure water.

My idea is to divide the alfalfa into small fields by portable fences, moving the fence when the alfalfa is eaten down and thus rotate from lot to lot, harrowing and irrigating each lot as soon as the hogs are taken off. I hope that those having experience along these lines wil give it.—W. R. Porter, San Bernardino.

Will our subscribers who have tried raising hogs on alfalfa favor this subscriber and others with their experience?

Peas for Cover Crops.

For the last two years I have sown Canadian field peas as a cover crop on my grove; both years had a good growth, but last January my peas were attacked by a small green fly, I suppose the pea weevil, and were partially destroyed before I noticed it. I at once set to work and disked them under. Now, would you advise me to sow peas again, or should I try vetch or some other cover crop?

My peas were sown early in September and disked uuder early in February both years. I may also say a neighbor a quarter of a mile away had about half an acre of garden peas destroyed in same way.—J. C. K. W., Redlands.

We do not think this was the weevil, but more probably the aphis, which attacks the young tender growth sometimes in such vast numbers as to almost cover the upper part of the plant from sight. They may appear again next season in the same way, but they are controlled largely by weather conditions. The vetch is an admirable cover crop, and even preferred by some to the pea, so if the seed can be secured it would be perhaps as well to make the change. Of course the pest can be destroyed by a weak kerosene emulsion spray, but in a cover crop this would hardly be practicable, and even with the garden crop is of slight value owing to the great rapidity with which the few that are left multiply and again stock the field. The pest is also kept largely under control by distributing the common ladybird which has been successful with the melon aphis of the Coachella Valley and kept it largely under control.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

California Farm Names

IN SPEAKING of the Cultivator plan of writing ranch names, the Livermore Herald says:

"It is noticeable that wherever a place bears a name over its gateway it is invariably a better kept place than its neighbor which does not. The custom seems to arouse the pride of every member of the family and every workman on the place. Every country home should be named for identification if no other purpose."

Apparently our subscribers are pleased with the plan. While many places have been named for years, the effort has not been made to establish the name in the minds of others. Some have painted the name over the gateway, some chisled on a big boulder, burnt on wood or otherwise marked so that neighbors soon learn it.

In sending in the name, a few notes add to the interest. What does the name mean? Or if coined from other words, mention the fact as Miss O'Mealey does in the following:

"Kanova Ranch," owners Mrs. P. J. O'Mealey, her daughter, Miss Bee Josephine, and Mr. J. S. C. Richardson, Anderson, Shasta county. Miss O'Mealey writes: "We have purchased this eighty-acre ranch five miles west of Anderson, which we have named 'Kanova,' a composite name made from Kan-sas, my birthplace, O-hio, our old home, and Nova Scotia, the former Richardson home. Our fruit packages all bear the ranch name and it is part of our address. We are most heartily in unison with you regarding the choosing of ranch names."

"The Orange Hague," owner, P. Ting, Plano, Tulare county. "As you request names for our homes I take pleasure in saying we have named ours 'The Orange Hague.' The word 'hague' is German and implies a bush, and as the orange tree has somewhat the appearance of a bush I thought the name appropriate. The Cultivator is improving all the time. We find it instructive and interesting."

"Roselawn," owner John F. Digmun, Norwalk, Los Angeles county. "I think your suggestion regarding the naming of the farm, especially where a person intends making it his home, is very good. Our place of twenty-five acres is named 'Roselawn' because we have the front yard and fences set to roses. The farmers will take more interest in their homes and farms when the public begins to talk of them under their individual names. Still better, let them market their produce under the farm name. Many Eastern farmers do this and it is general throughout Europe."

"The Gables," owner, Frank Mead, R. F. D. 1, Sutterville Heights, Sacramento county. "I have as yet seen no names from Sacramento county, but there are many ranches already named in this county. The name selected for our ranch is because of the architectural feature of the home and out-buildings. They are all constructed on the style of the English gable throughout. 'The Gables' is three miles from the capitol at Sacramento and within a half mile of the Sacramento river and fifteen minutes walk to an electric car line. I have twelve acres set to 3500 vines of table grapes; 100 almonds, 350 French walnuts and assortments of all kinds of trees for family use." We note from the letter head used by Mr. Mead that he was formerly a contractor and builder, and we hope that soon he will write us again on letterheads from "The Gables."

"Linda Vista," owner, J. W. Mills, Marysville, Yuba county. On a high knoll in Linda township Mr. Mills has chosen a most appropriate name for his beautiful view. The place is one mile from the electric line and four and a half miles almost directly east from Marysville. It is covered with beautiful live oaks and underlaid at a depth of 12 to 20 feet with a vein of water bearing gravel. Mr. Mills has just returned to the old homestead on which he was born after years of experience with the work of the State Experiment Station.

"Vista Grande," owner C. LeRoy Kennedy, Mountain View, Santa Clara county. "The ranch is given this name because of the magnificent view to be had of valley, hills and dales from our porch and windows."

"Maygrove Ranch," owner, A. T. Kenyon, Charter Oak, Los Angeles county. Mr. Kenyon has a beautiful embossed letter head and uses the finest grade of stationary. He writes "The name 'Maygrove' is taken from my wife's first name, May , and our ranch is an orange grove, which, combined, makes 'Maygrove'."

"Paulheim Ranch," owner, E. V. D. Paul, Ukiah, Mendocino county. Mr. Paul is growing some delicious cherries as the Cultivator force can testify.

"Sunnyside Ranch," owner, P. N. Warner, Sanger, Fresno county.

"El Verde," owners, Mr. and Mrs. Fred J. Smith, Pomona, Los Angeles county. This ranch is well named as the writer knows having walked over its magnificent stretch of green lawn and rested under the big trees of the grounds.

Mrs. Smith has taken the name of this ranch to use on the brands of her unfermented grape juice product, which is now commanding a market all over the United States.

"Alta Vista Ranch," owner, L. F. Sternmann, Wrights, Santa Clara county. "I have accepted your suggestion and we have just named our nome place 'Alta Vista Ranch'."

"The Swastika Ranch," owner H. C. Porter, Alpaugh, Tulare county.

"Green Mountain Farm," owner, G. S. Tranzettel, Ukiah, Mendocino.

"Shady Oaks," S. D. Phillips, Bachelor, near Saratoga Springs, Lake county.

* * *

In sending in names be sure and spell out name of ranch and of owner plainly. Make the letters U and N distinct. Likewise the A and the O are often confusing. In a straight English sentence the connection quickly determines the letter, but in a strange name it is not so easy, no matter how good the writing. For instance, in the above Mr. Digmun while writing an excellent hand might easily confuse a typesetter and have his name appear Dignum.

In case of any error in the names a correction will be made, if subscribers will promptly write in the correction.

From E. V. D. Paul, of Ukiah, comes some extra fine cherries of a variety originated on his mountain orchard. It has fruited five years and both fruit and trees are unusual and have received the most complimentary endorsements from experts.

TEA.

SPECIAL NOTICE TO TEA DRINKERS—Why not drink the best. Kanawalla Ceylon Tea is the finest flavored tea grown. 5-lb. caddy, $2.50; 10-lb., $4.50, prepaid. Write for samples, F. W. SPARR, 114 E. Market St., Los Angeles.

HURTIN' BIZNESS.

"Don't you know you're hurtin' biz'ness," said the red fox to the hound,
"When instead of sleepin' peaceful you come snoopin', sniffin' round?
What's the good of all your barkin'?
What's the use of all this fuss?
What were chickens ever made for if they weren't made for us?"

"Can't you see you're hurtin' bizness?" said the South Sea savage chief
To the fearless missionary who was sitting on the reef;
"I have seven white men captured that I want to sell as meat;
What were white folks ever made for if they weren't made to eat?"

"Don't you know you're hurtin' bizness?" said the robber in the jail
While the stubborn sheriff listened to his almost tearful tale;
"Those who make and sell the jimmies, don't you see, are losin' trade
While you foolishly confine me where no getaways are made?"

"Can't you see you're hurtin' bizness?" said the devil to the man
Who was steadily progressing on the live-and-let-live plan;
"You are keepin' men from fallin' who, if sorely pressed, might fall;
Why, if all men done as you do I would have no job at all."

—Chicago Record-Herald.

ON THE DEACON'S TRAIL.

DEACON ZEALAND'S wife had been ailing for several weeks, but was not considered in a serious condition when he went to the village one day to return and find her dead.

Her last hours had been smoothed by the hands of Harriet Short, a maiden lady of two score years, who lived near by and kept house alone.

The deacon was naturally affected when he came face to face with death. His wife had left him many messages, all of which were duly delivered.

He was asked not to mourn for her, as she was better off. The dying woman had named $35 as the limit price on her tombstone. Her patch work bedquilt was to be given to Mrs. White, her black shawl to Mrs. Brown, her poplin dress to Mrs. Smith, and she disposed of other things to other persons. In brief, she had died in a businesslike manner and provided for everything.

When Miss Short seemed to have finished telling everything, there was still more to come. While the deacon was wiping the tears from his eyes on the roller towel, she said:

"There is another message,—a very special one—but I do not wish to tell you about it for a couple of weeks yet."

"Did she want me to send her shoes to her sister Mary Ann? They both have the same sized feet."

"No. It was something far more tender and sacred. I couldn't really speak of the affair now without becoming overcome, and so we will please drop it."

Two weeks later her nerve had been restored. The deacon came over after milking time and sat on the front steps with her.

For a few minutes they talked about Farmer Johnson's oxen running away and tipping over a load of hay, and then the visitor suddenly inquired:

"Oh, by the way, wasn't there another message left by Jane for you to give me?"

"There was, deacon, there was; but I've been thinking whether I really ought to tell it to you or not. If Jane hadn't seemed in her right senses when she died, if there was the slightest doubt in my mind, wild horses couldn't drag the message out of me."

"But what on earth can it be?"

The old maid turned her head away.

"Harriet, don't keep a man in suspense," pleaded the deacon. "She didn't want me to marry her sister, did she?"

"She did not. She never hinted such a thing. In fact, her sister is not the woman to make you a wife, and Jane knew it. Please don't look at me, deacon. Look right at that hog on the other side of the gate. I was asking Jane if she didn't think she could eat some milk toast when her eyes filled with tears and she said:

"'Harriet, I have known you for twenty long years. I know what a hand you are to put up peach pickles and make soft soap, and I don't believe you have made a loaf of heavy bread in the last ten years. It will be for you—for you'"—

"For what, Hattie?"

"Must I tell it just as she did?"

"Just exactly. Don't leave out a single word."

"Then she said it would be for me to see that your future life was not made lonely. I know I hadn't ought to have told it; you said I must, and we have known each other so long, and I always thought so much of you"—

"Um!" said the deacon, as she failed to finish.

There was silence for a time. The old maid sighed, and the deacon sighed.

During the next three months it seemed as if the deacon was giving weight to his wife's last words, but all of a sudden he went off on a tangent. That tangent was the Widow Shipman.

He was seen hoeing in her garden because she had no one to hoe for her; he was heard to inquire after the health of her cow; he was seen carrying home five pounds of sugar and a jug of molasses for her.

Miss Short sat on her front steps five evenings running, and he never even stopped at the gate to ask her if the beetles and darning needles bothered her much. Then she threw herself in his way and looked at him reproachfully, and she followed the look by remarking:

"Deacon, do you know if the Widow Shipman has had one of her fits lately?"

"Fits? Fits? What kind of fits?'

"Why, epileptic, of course. I thought you knew. She has them every few weeks, I believe, and when they come on she grabs up the ax or any other thing handy and wants to chop things up. If you were working in her garden and she had one of them fits, she might split your head open before you saw her. I do wish you'd be careful, for my sake."

"Um!" replied the deacon, and he sauntered homewards to do some thinking.

It did not take the widow over a week to detect the change of temperature, and she wasn't a week longer placing the blame where it belonged.

As her cow had got a thorn in its nose, she was justified in calling in the deacon to extract it, and when the thorn had been removed, she planted another by saying:

"Dear me, I hope Miss Short is mistaken in thinking she has got cancer of the tongue. I know she's worried and don't want any one to refer to it, but it may only be a pimple, after all. We've all had pimples on our tongues."

"Um!" was the deacon's observation as he made a mental note. And next evening he took a quart of strawberries over to the widow and stayed to tea.

No matter how many widows and old maids are after a widower, he cannot with any decency marry until his wife has been dead a year. Deacon Zealand realized this and meant to abide by it, but he couldn't see any harm in looking around a little in advance.

Perhaps Miss Short would have captured him when it was time for him to be captured but for an unfortunate move of hers. She knew that he dropped in to see the widow of an evening occasionally, and she was dying to know whether the talk was all about the carpenter's dog biting an ear off of the minister's hog or whether it skirted the edges of love now and then.

Curiosity proved too strong at last. By going through her back yard, climbing a line fence, and walking up the widow's back yard, it was possible to arrive under the open windows of the sitting room and hear all the conversation.

One evening, when darkness covered the land and the busy hens had gone to their roost, Miss Short set out on her adventure. She had in the house an old coat and hat which had been given her to give away again to some tramp. She donned these and ambled on her way.

There is no doubt that a woman could climb a fence as well as a man if she practiced more, but she hunts for bargains in gloves and hosiery and lets the climbing go.

Miss Short got to the top without mishap. It was in maneuvering to descend on the other side that she did not allow for slivers. The first she knew she was caught on one and was hanging head downwards.

Any one who has even been in that position knows how uncomfortable it is. The sliver wouldn't give and her dress wouldn't tear, and after ten minutes of struggling, the victim had to call for help.

It was not one of the deacon's nights for calling on the widow after all. Mrs. Shipman was alone and heard the calls at once.

Unfortunately, she took Miss Short for a man, and picking up a club she lambasted her good and sound before proceeding to release her.

When she discovered the identity of the intruder, she exclaimed:

"Well, of all the things on the face of this green earth! Harriet Short, you were coming over to play the spy on me. Don't deny it. When I tell the people of this town" —

"But you mustn't never tell anybody."

"When I tell the minister and others that I caught you here in men's clothes, and that you"—

"You can have the deacon!"

"Oh, I can!"

"Yes. When he goes by my house in the morning, I'll make up faces at him."

"But he'll want to know why."

"Then I'll tell him that he is knock-kneed and toes in. Oh, please don't tell!"

"You'll let go of the deacon, will

you!" asked the widow, after thinking things over.

"I'll never look at him again."

"And if he asks you to mar—"

"I'll run him out the yard."

"Very well, Harriet Short, I'll keep the hat and coat as evidence against you, but let you go on those conditions. If you ever say a word or break your promise"—

But she never did.

Soon after the year of mourning was up, the deacon and the widow were married, and the deacon was replying "Um!" whenever the old maid's name was mentioned.—Cottonseed.

RECIPES.

Peanut Butter.

Use the Spanish peanuts. Roast in a moderate oven till light brown. Great care should be taken not to burn them. Rub off skins and grind in nut grinder. The secret of oily butter is slow feeding of machine, dropping one nut at a time, and the more revolutions

are made the better. Salt to taste after grinding.

Baked Apples.

So richly equipped in chemical elements is the apple that it is recognized as one of the easiest vegetable substances to digest and is, therefore, deservedly popular as a part of the daily menu. A baked apple is the most easily digested of any way of serving apples, but there are baked apples and baked apples. Just to put the fruit in the oven and to cook with a suitable heat to tenderness is by no means the worst way of preparing a baked apple, but there are various methods of seasoning and baking which serve variety, and variety serves the appetite most pleasantly.

One way is to peel the apples before baking. Core the fruit, fill the hollows with sugar and any preferred spice. Lay in an enameled baking pan, pour just enough water to cover the bottom, then bake in a moderate oven until tender, and delicately crisp on the surface. A bit of butter put on the top of each apple adds a savory flavor. Meanwhile take the cores and peelings, cover with water and stew for an hour. Strain, sweeten slightly, add a little grated lemon rind and pour over the apples. Whipped cream will be liked with these apples.

There are a great many changes to be rung on the baked apple filling. Any kind of nuts may be used. For a dozen apples a cupful and a half of meats will be required. Chop fine and mix with as much sugar. Fill the cavities and bake as usual. A half banana sprinkled with sugar and lemon juice makes a good filling. Figs and dates chopped and rolled in sugar, chopped nuts with chips of lemon or orange rind or honey and butter, are all appropriate and pleasant to the palate.

Honey Muffiins.

Sift together one and one-half pints of flour, two tablespoons baking powder, a small half teaspoon of salt. Work in two tablespoons butter. Beat and add three eggs, one teacup of honey and half a pint of milk. Bake in a hot oven.

Fruit Corn Muffins.

Take two cups of yellow cornmeal, one cup white flour, four teaspoons sugar, half teaspoon salt, two teaspoons baking powder, one tablespoon butter, two eggs, one and one-half cups of milk and one cup of any kind of fruit peeled or sliced. Bake in muffin pans in hot oven for twenty minutes.

Albany Breakfast Cakes.

Take three eggs, a pint of milk, half a teaspoon salt, two teaspoons baking powder and flour sufficient to make a thick batter. Beat the eggs very light and stir them into the milk. Have the flour sifted before measuring and add the salt and baking powder, then sift again and mix. Butter individual pie tins and half fill them with the batter. Bake in a quick oven.

HOMELY HINTS.

The dish towels will not only look better but will last twice as long if they are never allowed to become very soiled, for the hard rubbing required to get dirty towels clean again will soon wear them out, and the best and easiest way to keep them soft and white is to wash them out at least once a day in warm suds in which a little borax is dissolved, as the borax not only softens the water but purifies and disinfects. Both the towels and dish cloths should be boiled in the borax suds two or three times a week and then carefully rinsed and hung in the sunshine to dry. This last should be emphasized from a sanitary standpoint, as it is said that kitchen dish rags that are carelessly kept make fine breeding places for bacteria, which are frequently a menace to health and life. Save the dish cloths by using a whisk broom, a chain dish cloth or an old brush for washing the inside of pots and kettles and use bits of soft cloth for wiping the sides of the dish pan before you attempt to wash it, then these can be burned and there will be no grease to soil the cloth and make it grimy and dark-colored.

PAT'S REJOINDER.

Billy Craue brings this story from San Francisco to the Lamb's Club. A friend met a cheerful Irish citizen who had plainly suffered all that was the fate of the hardest hit. "Well, Pat, how are you making out?"

"Oh, Oi'm on me uppers yet, but I have a fine job in Honolulee, and fare paid. I sail to-morrow."

"Sure man, you'll never be able to work there. The temperature is a hundred in the shade."

Pat had endured too much cheerfully to be discouraged. "Well," he replied, hopefully, "I'll not be worruking in the shade all th' toime."

Hay.

As a matter of necessity, shipments of hay to the San Francisco market have been materially decreased during the past week, the total showing 2760 ton in comparison with 4290. The railroad yards were becoming so congested and the dealers found themselves at such a loss to know what to do with their consignments that many gave orders that shipments be discontinued for a while in order that the market might be cleaned up a bit. The situation here is uninteresting in every way, for consumers show no interest in the matter of filling up for the winter which is their general custom about this time of year. The dealers show no speculative tendency and the farmers seem to be in no great hurry to sell. They are gradually reducing their asking prices, however, so it may be that after a short time considerable quantities of hay will change hands.

There is very little to encourage the hay buyer at the present time for the trade outlook is a bit discouraging. There is very little doing in the export line, the movement of hay to coastwise points is exceedingly light and town trade is not more than two-thirds as heavy as it was a year ago. From all indications we believe that only at a very moderate range of prices will the regular hay buyers take on any quantity of hay for winter and spring delivery.

Although an occasional car of strictly gilt edge wheat hay sells for above quotations, yet the market shows no change from the range of last week, which we give as follows:

Citrus Market

LOS ANGELES, July 15, 1908.

There is little doing in citrus market. Lemons are going forward as fast as picked, some selling very low, but as a rule commanding fair price.

Orange packing houses are being refitted for next season's pack.

Shipments.

Total shipments to date are 26,251 cars, of which 3642 were lemons. To same date last year, 25,060, of which 27770 were lemons.

NEW YORK, July 13.—Five cars Valencias, one sweet, two mixed, one lemon and one navel sold. Market very strong; active on good Valencias. Clear; hot.

UNCLE ZEKE SAYS—

Most girls want tu be brides, but they hate tu be pointed out as sech.

Th' feller who kin look yeh in th' eye an make yeh believe him, sumtimes turns out to be a clever liar.

Lots uv wives kin boss their husbands an' at th' same time make 'em think they're not bein' bossed.

It's easier tu choose between two evils than it is between good an' evil.

A friend in need will never desert yeh—as long as there is enny prospect uv gittin' a loan.

There's sum consolashun in knowin' that even if worry does cause gray hair it doesn't necessarily make a feller bald.

War is a terrible thing—espeshally domestic war.

There may be bigger fish in th' sea than have ever bin caugnt, but they ain't enny bigger'n th' ones th' summer resorts advertise.

Luv kin always find a way, but sumtimes it's th' wrong one.—Journal of Agriculture.

BIBICAL CONUNDRUMS.

Why was Noah obliged to stoop on entering the arch?

Because Noah was a higher ark (hierarch.)

When did Moses sleep five in a bed?

When he slept with his forefathers.

Why was the giant Goliath very much astonished when David hit him with a stone?

Because such a thing had never entered his head before.

SHE KNEW.

"I hear you are going to marry Charley?"

"Yes; he asked me last evening."

"Let me congratulate you. Charley is all right. He is one of the nicest fellows I was ever engaged to."—Nashville American.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Warts.

I have a Jersey cow with some bad warts on one teat. Can you furnish me any remedy for same? These do not seem to be ordinary warts as they are long in shape and have several sharp points to each. These completely cover the inside of the teat.—E. S., Fullerton.

Have the following made up: Arsenious acid, two drams; Lanoline, two ounces. Rub into warts once daily being very careful not to get any into milk as it is very poisonous.

SOMETHING NEW FOR THE RANCHER.

The Pacific Portable Construction Company, the advertisement of which appears in this issue, manufactures the most complete line of portable cottages, garages, poultry houses and servants' quarters of any firm on the Pacific Coast.

Mr. Barker, the manager of the firm, was for twenty years superintendent of one of the largest wood working establishments in New England. This work brought him in touch with the best builders and architects, where he had ample opportunity to study the designing and construction of portable houses. The portable house business is not new with Mr. Barker as he built them for a number of years in New England before coming to California.

The general design and architecture of these houses are far ahead of anything now on the market. They are also made convenient and substantial and at a price cheaper than one can build them themselves, as he buys his lumber in large quantities, has machinery and patterns, so that he is able to save where ever it is possible. If you are in need write for circulars and prices. Factory at Topeka and Alameda streets, Los Angeles, California.

A GOOD ROOF.

A good barn deserves a good roof as well as the home and other outbuildings. A roof to be "good" in California, must not only afford protection against rain, sun and wind, but also against destructive forest fires.

Realizing this last requirement, the H. W. Johns-Manville Company of Los Angeles, has had on the market for many years a Pure Asbestos Roofing which combines all of the needful qualifications.

This material is also prepared in suitable form for siding of buildings, so that the owner having his barn and other buildings completely covered with "J-M" Asbestos Roofing, is fully protected against destruction by fire from etxernal causes.

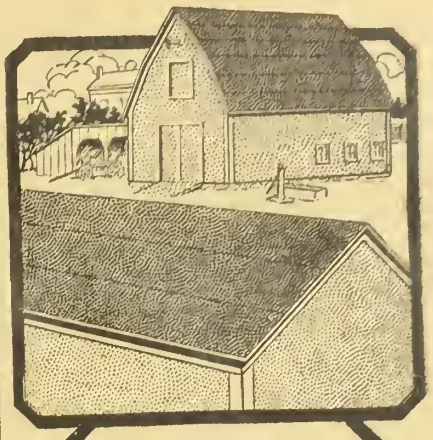
They carry a large stock of their extensive line of building materials at No. 203 East Fifth street, Los Angeles, where you are sure of a cordial reception.

Catalogues and samples of any of their line will be gladly sent upon receipt of request."

THE SURE RESULT.

Teacher—If you are kind and polite to your playmates, what will be he result?

Scholar—They'll think they can lick me.



The Guardian of Your Buildings

The finest thing about REX Roofing is the sense of security it gives. You don't have to worry about REX. You know that a building roofed with it, is roofed as well as can be, and protected as thoroughly as can be. The hardest storm cannot get water through it, nor blow it off; the hottest sun cannot melt it nor open its seams; falling sparks cannot ignite it.

REX
FLINTKOTE
ROOFING

is durable; it is good all through. Its body is high grade, long-fibre wool felt, heavy, dense and durable; the saturation or waterproofing is slowly worked in until the body is thoroughly impregnated with it—REX saturation will never dry out; the coating is of special rubbery, gummy compounds that unite with the body and the saturation.

WRITE for BOOK and SAMPLES, FREE

The book will tell you all about Rex Flintkote Roofing. The samples will enable you to test its properties.

DIVIDEND NOTICE.

San Francisco Savings Union. N. W. Cor. California and Montgomery streets.

For the half year ending June 30th, 1908, a dividend has been declared at the rates per annum of four and one-quarter (4¼) per cent on term deposits and four (4) per cent on ordinary deposits, free of taxes, payable on and after Wednesday, July 1st, 1908.

Depositors are entitled to draw their dividends at any time during the succeeding half year. A dividend not drawn will be added to the deposit account, become a part thereof and earn dividend from July 1st.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The Savings and Loan Society. 101 Montgomery St., Corner Sutter St., San Francisco.

For the half year ending June 30, 1908, a dividend has been declared at the rate of 4 per cent per annum on all deposits, free of taxes, payable on and after Wednesday, July 1, 1908. Dividends not called for are added to and bear the same rate of interest as the principal from July 1, 1903.

WM. A. BOSTON, Cashier.

TOO TRUE.

After our landlord had pocketed the thirty dollars which we pay monthly for our little apartment, he blushed painfully.

"Why do you color so?" I asked.

"Because I have a rent in my trousers," he murmured.

Questions and Answers on Hog Cholera

A Series of Instructive Replies Regarding This Dread Disease Issued by the Veterinarian of the Department of Agriculture of the Philippine Islands

THE Philippine Agricultural Review recently contained the following questions and answers on cholera. They were written by Dr. David G. Moberly, veterinarian of the Bureau of Agriculture of the islands. They are in no sense technical and for the crudest of the farmers of the Philippines. In the article there is such a fund of information that we give it in full.

HOG CHOLERA.

Question 1. What is hog cholera?

Answer. Hog cholera is a very highly contagious disease affecting swine.

Question 2. Does hog cholera exist in the Philippine Islands?

Answer. Yes. The disease has been found in every part of the Archipelago where hogs are raised.

Question 3. Is the disease of much importance here?

Answer. Yes. The loss sustained by this country through the death of swine by cholera amounts to many thousand pesos annually.

Question 4. Do all swine affected with cholera manifest nearly the same symptoms?

Answer. No. Many of the symptoms presented in different outbreaks and among different swine in the same outbreak are entirely different. This fact has led many veterinarians who have studied the disease to divide it into three forms.

Question 5. What are these three forms?

Answer. First, the septicemic form, which kills very quickly, and causes but little change in the tissues; second, the pulmonary form, known as swine plague, in which the principal changes are found in the lungs; and third, the intestinal form, usually spoken of as swine fever or hog cholera proper.

Question 6. Are all these forms of the disease ever present in the same herd of swine?

Answer. Yes; but usually they are not very distinct.

Question 7. What are the symptoms presented by hog cholera?

Answer. In the acute or septicemic form, the animal, without showing any previous symptoms, suddenly ceases to eat and becomes dull. Soon a very high fever is present, accompanied by rapid and labored breathing. Blood and mucus may pass from the nostrils. The animal vomits, staggers and falls down. Death usually takes place in from three to ten hours from the time the first symptoms are noticed. In the pulmonary and intestinal forms, which are less acute than the septicemic form spoken of above, the animals affected gradually lose their appetite and become depressed and weak. The back is arched, the head lowered and a short, painful cough is present. There is a moderate fever; a thin, watery discharge from the eyes and nose which later changes into a thick, sticky semi-fluid substance, which, upon drying, often completely closes the eyes; the breathing is rapid and of a pumping, panting character. The mucous membranes about the eyes, nose and mouth change to a dull, dirty blue, and red blotches appear on the skin, covering the underside of the body, the inner side of the limbs, and the area close behind the ears. The eyes are sunken, of a lead color, and often show irregular, reddish lines representing enlarged blood vessels. The animal is constipated during the first stages of the attack, but soon a characteristic greenish, ill-smelling diarrhea sets in. Death takes place in from three to ten days.

Question 8. If an animal that died from the effects of the septicemic form of hog cholera be opened, what changes from the normal would be noted?

Answer. In many instances no alterations can be seen without the aid of a microscope. In some cases on the membranes lining the thoracic and abdominal cavities small red spots can be seen. These red blotches might also be noticed just under the skin on some parts of the body, in the walls of the intestines, in the substance of the kidneys, and in the lymphatic glands.

Question 9. What changes in the tissue are found upon opening an animal dead from the effects of the less acute forms of the disease?

Answer. The changes mentioned above are present, and in addition the spleen is enlarged, soft and dark colored. Portions of the lungs may be very dark, nearly black in color, and upon cutting into these areas a bloody fluid mixed with pus is found. The mucous membrane lining of the stomach and intestines is much inflamed and reddened. In the lower portions of the small intestines, in the caecum, and in the large intestines numerous ulcers are found. These ulcers, which vary in size from one-eighth of an inch to 2 inches in diameter, project above the surface of the mucous membrane, are irregular in outline, and have a yellowish, black color. All the changes described above are not always found in every case examined.

Question 10. What, then, is the most important thing to look for in deciding whether the animal has died of hog cholera?

Answer. The ulcers in the intestines, for if the animal has died with cholera (other than the acute form) the ulcers will always be present to a greater or less extent.

Question 11. What should be done when swine commence to die of a disease supposed to be hog cholera?

Answer. The sick swine should be killed and burned. The well ones should be removed from the place where the sick ones were running, and should be divided into small lots and confined. They should be observed closely and if any show the least indications of not being well they should be removed from the rest. Each day all swine should be dipped in a 2 per cent solution of creolin, or some other similar disinfectant. If the facilities for dipping them are not at hand, they may be sprayed or washed with the same solution. The lots and sheds where the swine are kept should also be sprayed or sprinkled daily with a disinfectant. Healthy swine should not be allowed on grounds or in buildings where sick hogs have been until these grounds and buildings have been thoroughly disinfected. Often where the infected area is so large that it is impracticable to apply disinfectants it may be plowed and cropped, which will destroy all cholera infection the soil may contain.

Question 12.—How long after hogs are exposed to hog cholera do they commence to show the first symptoms of the disease?

Answer. From seven to fourten days.

Question 13. In an outbreak of hog cholera what percentage of the swine attacked by the disease recover?

Answer. About 5 per cent.

Question 14. How is hog cholera brought from one section of the country to another?

Answer. In most cases by sick animals being transported from one district into or through another.

Question 15. How is a non-infected herd of swine usually infected?

Answer. In the majority of cases this is brought about by an animal which has been exposed to the disease being purchased at some place more or less distant and immediately turned among the non-infected swine. In a few days the newly purchased animal is sricken with cholera and infects the whole herd. In some cases a stray or wild hog contracts the disease and in its wanderings infects all the swine in that section of the country. Infective material may be brought to the herd by carts or other conveyances which have passed through an infected district, or by carts which have been used to transport sick swine. The infection may also be carried to the herd on the feet of men, dogs or other animals. Birds often carry the infection a long way.

Question 16. How may birds carry the infection of hog cholera?

Answer. By carrying small pieces of flesh torn from carcases of swine dead of hog cholera and dropping this flesh where healthy swine will find and devour it.

Question 17. How should a healthy herd of swine be managed so that they may be kept free from hog cholera, even though this disease be present in the locality?

Answer. They should be confined by a double fence to protect them from diseased hogs without. No swine that have not been held in quarantine for at least four weeks, and found to be healthy at the end of that time, should be placed with the well ones. The caretakers of the healthy herd should not assist in the care of any other swine. Nothing should be taken into the inclosure where the hogs are kept that has been in contact with sick swine, or in an infected district. Isolate any animals that show the slightest ysmptoms of disease.

Question 18. Is there any cure for hog cholera?

Answer. No.

* * *

The recent investigation by the U. S. Department indicate that a cure is now very probable.

Riverside people are complaining because of rolls of butter which are often four ounces short of the two pounds weight which is supposed to make up a roll of butter. Unless this shortage of weight is plainly indicated on the wrapper of these packages we do not think the people of Riverside will have much trouble in securing a correction of the weights.

The preliminary estimate of the acreage planted in corn is 100,996,000 acres, an increase of 1,065,000 acres, or 1.1 per cent, as compared with the final estimate of the acreage planted last year.

HOW ORANGES ARE AUCTIONED.

THE following originally in a Boston paper and reprinted in a Tulare county paper, is an interesting account of the manner of handling of oranges in the Eastern auction:

A mile of boxed oranges in one long mass is the luscious spectacle to be seen almost any morning now within the walls of a big freight house that stretches its 600 feet of length into the Fitchburg terminal yards of the Boston & Maine railroad from the Charleston end of Warren bridge.

As a matter of fact the oranges daily on view would reach much more than a mile, say nearer two miles, if the boxes, piled high over nearly the entire floor space from end to end of the building were strung out in a double row three boxes high, instead of in 8 or 10 rows, as they are usually arranged.

Such a mammoth display of oranges may well excite the wonder of one who views it for the first time. The beautiful yellow fruit makes one's mouth water. It is not oranges alone that are to be seen, thousands of boxes of lemons are piled there, too, as well as great stores of golden-hued tangerines and large round grapefruit.

The big freight house is the special nabitat of the Boston fruit auction, and the great stacks of fruit piled within it come direct from California by fast refrigerator trains, to go under the hammer of the auctioneer.

This Boston fruit auction is a big institution in its way, and for many years nas been an important feature of tne commercial life of the city. Through it not only Boston, but most of New England, parts of Canada and tne Maritime provinces are daily supplied with fruit of different kinds. Every morning of the week throughout the year, with the exception of Saturday and Sunday, large consignments of oranges, lemons, tangerines, grapefruit, peaches, pears, plums, grapes, cherries and other pomological riches of California pour into the Boston market, each variety in its own season.

The auction business done there is vast in volumne every day. Two hundred and 300 buyers attend the auctions, and there is some spirited bidding. Thousands of tons of fruit are knocked down in the space of a few hours to the crowd of buyers, who dispose of it at both wholesale and retail.

In midwinter the season of California oranges, lemons, tangerines and grapefruit is at its best, and the sales of these constitute the whole business of the fruit auction.

The freight house is divided into two sections for the purpose of the fruit auction. On the lower floor, for the whole length of the building, the fruit is deposited and arranged in carload lots, according to grade and quality in long tiers six or seven boxes high, the top box of each tier being uncovered in order to show the size and quality of each lot.

The auction sales are held in a large, spacious hall in the second story of the freight house, added for this special business. There is a wide rostrum for the auctioneer at one end of the room, with an auction block above all.

Representatives of the Boston receivers of the fruit, to whom it is consigned by the California shippers, and the auctioneer's clerks sit at the desks keeping tab on the sales. In 15 or 20 rows of chairs that fill the b[illegible] hall is the crowd of buyers upon the business on hand.

[illegible]dy of the intent [illegible]ce

The fruit buyers get to the pl[illegible] early in the morning and put in a pr[illegible] liminary hour or two looking over the tiers of fruit displayed on the lower floor.

Each one carries an auctioneer's catalogue descriptive of the kind and quality of the fruit and the amount in each lot to be sold, the different lots being designated by numbers and sold under those numbers.

The buyers pass from pile to pile through the long rows critically examining the fruit in the open sample boxes. From 9:30 to 12 are the hours of the auction sales. When the buyers finish their inspection of the fruit all hands mount the stairs to the hall above for the sales.

To see and hear the Boston fruit auction in full action is an experience well worth the time given to it. The people who fill the buyers' seats make up an interesting assemblage. In the front seats are seen a big number of big fruit dealers from the market district and elsewhere in Boston, representatives of large grocery houses, and brokers acting for fruit merchants in many parts of New England, all of whom buy frequently by the carload.

Back of these heavy weight traders are ranged a large crowd of push cart hucksters and peddlers who may boast the ownership of a horse and wagon—Greeks, Italians, Armenians, Hebrews, Yankees, Irish,—whose talk is babel. Good nature reigns in that international gathering. All are expert buyers of fruit, and it is simply business with them the whole time they are at it.

At the first auction business moves at wonderful speed. The tone of the auctioneers, the bidding of the buyers the announcement of sales, the calls of the clerks, everything is of the rapid fire order. There is not a minute wasted there; the man who wants to buy fruit must act quickly if he would get in the game.

Sharp at 9:30 on a recent day auctioneer J. C. Macomber, the first up mounted the rostrum, and with a sounding whack of the gavel on the pulpit like block announced the opening of the auction. Then he started in at once on a whirlwind plea for bids, and fruit went with a rush After selling several cars of oranges Mr. Macomber gave way to the second auctioneer, Frank L. Ripley.

Mr. Ripley, a bundle of nerves and energy, was stripped for the fray. Coat. collar, vest, cuffs and necktie, and even suspenders were peeled off, and with shirt sleeves rolled up above the elbows he dashed into the task of taking the dollars out of the pockets of the buyers of 11 cars of oranges and lemons. It was touch and go at a mile-a-minute clip with him.

A star rapid fire team of the vaudeville stage is as an ice wagon to a racing motor car in comparison to the fruit auctioneer in conversational speed. The outsider cannot understand a word in ten. It is all Fegee or Choctaw to him. But it is good, plain, understandable English to the crowd of push cart men and peddlers in front. At different stages during the ceaseless torrent of language pouring from the mouths of the auctioneers the push cart men got worked up to a high pitch of excitement in

Agents Wanted Everywhere

YUCCA MANUFACTURING COMPANY
1380 Willow Street Los Angeles, Ca[illegible]

their eagerness to get a bargain. They shrieked out their bids in shrill voices, arguing all the time with each other or the auctioneers gesticulating wildly with the catalogues in hand, waving to and fro above their heads. A splendid, realistic Roman crowd they would make for the play of Julius Caesar.

When the auction closed about 600 boxes of oranges and lemons had been sold. But this happened to be a poor day in the matter of business. Often as high as 30 cars of oranges are sold in a day. That is about 12,000 boxes, something more than 384 boxes being counted to a car. This would make fully 120,000 dozen oranges disposed of at a single sale.

About 2000 cars of oranges are sold at the fruit auction in the course of a year, or more than three-quarters of a million boxes, representing at a conservative estimate 10,000,000 dozen oranges. Although 3000 carsloads of fruit of all kinds are auctioned off there every year.

Only California fruits are sold at the auction, those from Florida, the West Indies and from Spain and Italy, Malaga and other varieties of grapes coming across the ocean from the two latter countries being disposed of at auction rooms on State and Clinton sts. A large part of the Florida oranges and grapefruit, however, is consigned direct to commission merchants in the market district.

Of the California fruits, the cherries begin to come into the fruit auction the latter part of May. They are succeeded by the peaches, pears and plums and later comes the grapes, principally the Tokays, of which about 325 carloads pass through the auction every fall season.

But California oranges have come to be an all-the-year-round fruit in Boston. They are always arriving, and there is no day in the year when oranges are not sold at the fruit auction. It is estimated that each car of fruit disposed of there brings in $1000, and that a total of nearly $8,000,000 worth of it is sold at the fruit auction during the 12 months of the year.

CONTRAST OF FRUIT GROWING.

In a recent issue the National Nurseryman contrasts citrus fruit growing in Florida and California as follows: ,

The two great citrus fruit sections, California and Florida, while alike in certain features, present more contrasts than resemblances. It was recently my pleasure to visit the two successively for the purpose of investigating the citrus fruit industry, and comparison was inevitable. The striking contrasts in the pursuit of this industry in the two sections seem to result from a few fundamental differences, especially those of climate, inhabitants and capital.

The climate of the citrus section of these two states, while similar in being more or less free from frost—though never from the fear of it—differs widely in humidity. California is so dry and arid that irrigation is essential, while Florida is humid even to excess. This large difference alone is the cause of many lesser ones. For instance, the hot, baking sun of the cloudless California summer makes a dust mulch necessary to conserve the moisture, hence clean and thorough tillage is the rule in the citrus groves. Evaporated water can, to be sure, be replaced as necessary by irrigation, but water is too expensive and often too scarce to be used recklessly, and as much as possible is conserved by cultivation. But in Florida no such compelling reason exists for thorough cultivation, and the groves are consequently weedy, grassy and untidy. The humidity promotes not only weediness, but an inclination in the man to let them have their way; and slackness having thus insinuated itself, appears again in the carelessly pruned trees, whose roughness contrasts strongly with the beautiful symmetry and uniformity of California trees. Then again, irrigation requires skilled and intelligent labor and this kind appeared to be commoner in California than Florida. The Japanese is certainly far superior to the negro.

California is full of well-to-do people, who have gone there because of ill health, and attracted by the outdoor life have turned to orange growing. The industry has thus been built up to a large extent by people of more than ordinary training, ability, and means, and this is strongly reflected in the strictly modern methods of handling the groves and marketing the crops. Coming from the cities, the growers had no preconceived notions about fruit raising, but depended largely on the publications of the agricultural press and experiment stations, with strikingly successful results. Being thus guided, and acting on sound business principles under the direction of an extensive and remarkably successful fruit union, they have concentrated their efforts on a very few varieties, like the Washington Navel and Valencia among the oranges, and the Lisbon, Eureka and Villa Franca among the lemons, producing immense quantities and absolutely controlling the market for these sorts. In Florida the varieties of oranges grown are far more miscellaneous, and do not make as imposing a figure on the market even comparatively to the amount produced.

Very few lemons of any sort are grown, but more attention is given to grapefruits than in California, and the best and intensest development of the citrus industry in the State promises to be along that line. There is noticeably more enthusiasm among the growers of California than those of Florida. In the West every man is a promoter—whether a real estate dealer or not—eager to show the visitor about, and fill his ear with the golden prospects of the country; while comparatively little of this aggressive and exultant spirit is displayed in the South. The average Florida grower is more often a son of the soil, reluctant to adopt new machinery and methods, and content to put a product on the market a shade or two less than perfect.

The frequent large size of the citrus groves in California is very impressive to the visitor, several thousand acres in some cases being under one management, and indicating unmistakably the presence of abundant capital. In Florida, on the other hand, groves of a hundred acres are rare indeed, and small plantations the rule. Thus it has come about that on the one hand superior and uniform methods of handling, marketing and advertising the fruit have been evolved, while on the other the individual taste or caprice of the small grower has had the upper hand, and uniformity in such matters as grading and packing is still unattained.

In each of the particulars examined, then, Florida is inferior to California, even as she is in the amount of citrus fruits produced; and though she is less developed than her rival, and for many years will continue to reduce the interval between them, the supremacy of California seems indefinitely secure.

OLD FRIENDS MEET.

"Hello, Bill, when did you get here from Arkansaw?" "Just the other day." "Well, how is it down there?" "Well, a little wetter than here. Why, say, Sam, where did you get that wagon?" "Say, Bill, that is a peach, yes, a Loula, see those wheels, four-inch tires, rivet rims, double strength axle and they say every piece of timber in that wagon is seasoned naturally, no incubators used in their factory, and you know, Bill, when we used to dig up hickory roots for mauls and dry them in the stove they were no good, and if we laid them up in the loft for one or two years they were like iron. Well, says I to the man, there is one wagon in town that is all nickory and he explained to me that it was not, but he took a saw and cut out a spoke and showed me that this wagon was oak spokes, with timber in them like we used to make fish traps out of. Well, says I, that is good enough for me and I just hooked on to it and here I am." "Well, Sam, I want a wagon so I will go down there and if they will make me the right price I guess I will take one. Let me see what is the name?" It is a Newton and I got it from the Los Angeles Vehicle and Implement Company, 110 & 112 North Los Angeles St. Well, don't forget the number, Bill, and you and Susan and all the children come over Sunday."

Deciduous Fruit Culture

ENGLISHMEN LIKE OUR APPLES.

Six years ago the shipments of apples to London was only 25,000 barrels a year. Now the Englishmen take about a million barrels and want more. The shipments this year will be larger than ever before, and prices will be good. The Western apple shipper is beginning to find out how the Englishman wants his apples packed and is trying to accommodate him.

The old-fashioned apple-barrel is no longer to be tolerated, and all good fruit is now packed in boxes, every apple being wrapped in paper. But the eastern grower, strange to say, did not appreciate the new method of packing, and it is a fact that the great growers of New York have not been shipping as much fruit abroad for this reason as the growers of Missouri, California, Oregon, Illinois and Michigan.

The western growers evidently know their business. They sell their apples for $3 and $4 a box, and as it takes three boxes to make a barrel, this makes a very high price for the fruit. At $9 per barrel there is a fortune in apples. The English seem willing to pay the price, and even complain because they cannot get more.

Apples are no longer shipped from New York on slow vessels or tramp steamers, but are sent on the fastest ships affoat. The Celtic and the Cedric are the joy of the apple-shippers, because they carry enormous loads and make good time.

Inspector Bayard C. Fuller of the New York Health Department, who has attended to this part of the export trade of that port for seventeen years and more, is quoted as saying:

"New York is the best apple-yielding State, and growers should not be willing to take a back seat in this box idea. If they do they will find themselves confined to the cheaper grade of apples. Did you know that New York City sells as many apples for home use every year as are shipped abroad? Our average is 1,000,000 boxes or barrels a year here, and we should get the best."

Some attempts have been made to introduce the American apples into Germany, but the Kaiser treats them as he does most importations from this country. Every apple shipped must be absolutely without a flaw. If an apple has a speck on it it is assumed to be something that will spread contagion in the Kaiser's own applelands and ruin his crops.—American Farm World.

It is charged that some of the canneries of Central California have encouraged the report that it was impossible to market canned goods at any price this year in order to bear the market on green fruit.

DRYING PRUNES.

Prunes are usually gathered by shaking from the tree; sometimes on sheets, more often on the ground. Then after gathering they are sometimes graded, sometimes dipped as gathered. The grading is done over inclined planes of adjustable slats or over riddles of wire mesh of various sized openings.

Dipping.

Dipping is to thin or crack the skin so as to make quicker or more even drying of the fruit.

Dissolve one pound of best potash in 20 gallons of water and keep boiling hot. Put fruit in wire baskets or pails with perforated sides and bottom, and plunge in the boiling lye for a few seconds or a minute until fruit is cracked slightly. Riper fruit requires longer than the greener, plumper fruit.

Swing the basket at once to clear, cold water and rinse—though some do not rinse at all—then spread on trays.

Drying.

According to the weather the drying will be complete in one to two weeks. In case of fogs or rain stack the trays and when nearly dry enough, the trays may be stacked to finish.

"Sweat" in bins or boxes for two or three weeks before sacking or grading for boxing.

Finishing.

Before boxing they are sized—40 to 50 to pound, or 50s-60s, 60s-70s, etc., then "finished" or glassed in steam, hot water or sometimes a syrup made up of cull prunes. This is to kill insect eggs. Plump or swell the fruit; likewise the packer's profits.

More recently a method of canning the dry fruit and submitting to very high temperature, has been followed with success.

A CALIFORNIA DRYING YARD.

CODLING MOTH PARASITE.

Mr. M. De Hurst writes to the Woodland Democrat regarding his work with the codling moth parasite:

In your issue of the first instant I note an excerpt from the California Cultivator deprecating the services of the codling moth parasite, and advocating the continuance of spraying as a means of destroying the codling moth. Last season farmers and fruit raisers in various sections of the State received some of these parasites and it would be interesting to know their experience, if indeed sufficient time has elapsed to form any conclusion. Last fall I received from the horticultural department a small frame said to contain the eggs of the codling moth parasite. The instructions were to fasten the frame in a shed or on an apple tree, and await results. There were three trees in the garden which had borne full for several years, but the fruit was utterly useless, being honeycombed by the codling moth larvae.

Each season before the apples were as large as they are now, the work of the apple pest was apparent. The brown "borings" appeared at the calyx and often on the sides, indicating the presence of larvae within. But this season there is not a sign of the pest although the trees are so full of fruit that it had to be thinned.

It is too early to determine the efficacy of the parasite, nor can anything definite be determined from an isolated case like this. We can not tell whether the pest will appear later, or whether its absence, if permanent, is the result of the parasite's work or results from the pecularities of the season or some other cause. Others of your readers must have had experience with the pest and also with the pest parasite. It would be interesting to know their experience, and whether they have succeeded in destroying the codling moth, and if so, by what means.

Marion county, Oregon, is puffed up over winning the $150.00 silver cup at the Salem Cherry Fair.

THE CHERRY AND PEAR TREE SLUG.

This insect did great injury to cherry, plum and pear trees in parts of Colorado last year. It is one of our easiest insects to destroy and no one who grows these trees should allow them to be seriously injured by it, writes C. P. Gillette, Entomologist, Colorado Agricultural College.

The slug is of a dark brown color, slimy in appearance, and does its injuries by eating off the green substance of the upper surface of the leaf, causing foliage to turn brown as if scorched with fire. There are two broods of this insect each year. The adult is a black, four-winged fly which begins to deposit its eggs in the leaves about June 1. This is done by inserting a sharp ovipositor just beneath the cuticle of the leaf where one egg is deposited; a little brown pimple can be seen upon the upper surface of the leaf. In about a week these eggs hatch and the little slugs crawl out upon the surface and begin to feed. In about two weeks more they become mature, crawl to the ground and spin little silken cocoons, where they remain for two or three weeks longer, and then hatch into another brood of black flies like those that began in the spring. These also deposit eggs in precisely the same manner as the preceding brood, but usually in far greater numbers, so that the principal injury is commonly done during August

The Temper of a Fork

and early September, when they often almost completely destroy the leaves of the trees, and at a time of the year when the trees can least afford to spare their foliage. It is too late for the trees to put out new leaves before winter, and without the service of the leaves at this time of the year to manufacture the starchy food material which is to start plant growth in the spring, the trees are likely to die. In the warmer sections of the State, the spring brood of this insect is already present in the orchards.

Remedies.

The slugs feed so freely upon the surface of the leaves that they are very easily killed by any of the arsenical poisons, such as arsenate of lead, arsenite of lime, or Paris green applied in moderate strength. One pound of the arsenate of lead to each twenty-five gallons of water, or one pound of the Paris green to one hundred gallons of water, will make a preparation of sufficient strength to promptly destroy this insect.

Sometimes it is necessary to make an application when cherries or plums are nearly grown, when it is not advisable to cover the fruit with an arsenical poison. In this case one can use white hellebore in water in the proportion of one ounce to three gallons. If the hellebore is used, it is a little better to apply towards evening. Try to distribute the spray as evenly and thoroughly as possible to all the leaves of the tree without using enough to cause it to run off to any great extent.

Where only a few trees are to be treated, one may use air slaked lime or fine road dust, throwing the dust very freely over the surface of the leaves. This remedy is not quite so effectual as the preceding, but can often be used with entire satisfaction.

There are in the United States about twenty-five kinds of nut-bearing trees which are notable for their beauty as well as for their valuable products, not only of food, but of the high priced timber they furnish as well.

The consumption of nuts is increasing rapidly, as is evidenced by the large and regular increase of importations. The demand for nuts and nut products is evidently growing much faster than the home supply is increased.

The San Bernardino County Horticultural Commission has commenced an active war against the Russian thistle.

Sonoma has a new fruit warehouse under construction.

California Horticulturally

FARMERS AND THE DEPARTMENT OF AGRICULTURE.

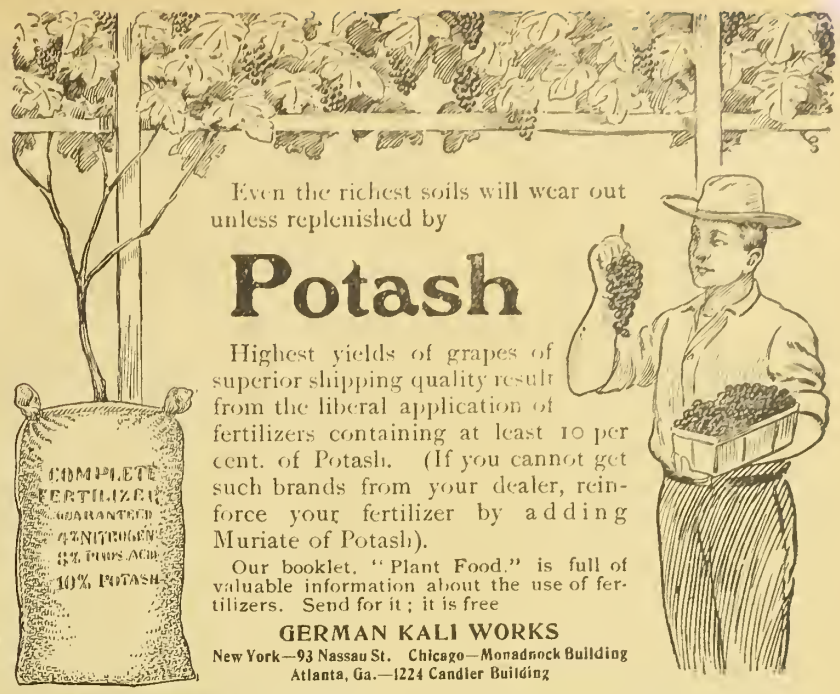
The fruit growers and farmers of California owe much to the Department of Agriculture for the great efforts which it has made in their behalf. This great department has ever been ready to listen to the needs of our great producing class and extend to them a helping hand. When the pear blight struck our great pear sections and threatened to wipe out one of the greatest of our fruit crops, it was the Department at Washington that sent out a corps of experts, and they went into the field and took up the work until a thorough job had had been made of it. Today, thanks to the instructions of these men, our pear growers know how to handle the disease, and while the pear industry has received a severe setback, it is still in the ring and California is yet shipping pears. When the peach blight, in its turn threatened another of our fruit crops, it was the Department experts who told us what to do to ward it off.

The orange growers of the State have been saved many thousands of dollars in annual loss by the experiments of G. Harold Powell, another agent of the Department, and this work it is stated is now to be extended to the deciduous fruit sections of the State. The experiments now being carried on into the proper and most effective and economical use of cyanide in the fumigation of trees, promises to be equally as effective. Beside these there are experts working on weed control, soils and their adaptation to crops, animals and their diseases, and many other branches all designed to make the toil and care of the farmer less and his income greater. Most effective work has already been done in all branches and not the least of these is the thrips investigation now in progress in Santa Clara county, which it is hoped will result in the discovery of some remedy for that destructive pest of the prunes.

THE CANADA THISTLE.

The Canada thistle, or as it is appropriately named sometimes the "cursed" thistle, has been reported from several parts of the State, and it is probable that it has obtained so firm a foothold that its extirpation will be very difficult if not impossible. Very many of our common and less harmful thistles are often mistaken for this weed, which is easily recognized when once seen. It attains a height of from one to three feet, and differs in its more slender habits, its narrower, thinner, paler, more curled and deeper cut leaves, less rigid prickles and smaller flower heads from the common or bull thistle. It bears numerous purple flower heads, each of which contains many individual flowers. It spreads from underground roots, which live from year to year and spread out in all directions. It is for this reason that it is enabled to spread so rapidly and is so difficut of extermination. These underground stems form buds at the joints which grow upwards and form new plants. If cut or disturbed each of these buds starts a new colony and every effort to rid the soil of it, unless performed with the greatest care, serves only to spread it. It will stand drought and rough treatment and is one of the worst of weeds to get established. No plant of it should ever be allowed to seed, and where it is found the roots should be turned up to the summer sun and kept from all water until they perish. Once thoroughly established it will rank with the morning glory or Johnson grass.

The Trabuca Canyon and San Jacinto National Forests in San Bernardino and Riverside counties will hereafter be known under one name, which is the Cleveland National Forest. This is in honor of ex-president Grover Cleveland, who was the first president to issue a proclamation establishing national forests.



Even the richest soils will wear out unless replenished by

Potash

Highest yields of grapes of superior shipping quality result from the liberal application of fertilizers containing at least 10 per cent. of Potash. (If you cannot get such brands from your dealer, reinforce your fertilizer by adding Muriate of Potash).

Our booklet, "Plant Food," is full of valuable information about the use of fertilizers. Send for it; it is free

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

General Agriculture

PROPAGATION BY CUTTINGS.

A CUTTING for propagation is an entirely detached portion of a plant, usuallly a shoot or part of a shoot, furnished with buds and leaves. When properly selected, duly prepared, and placed under favorable conditions, the cutting forms a callus, which resembles in some respects a wart on the human hand. From this callus roots will be emitted, and thus an individual plant is formed, which may again be increased to an extent corresponding to the number of parts eligible for cuttings which the plant can afford at once or in succession, writes Hugh Reid in Agricultural Gazette N. S. W.

For instance, if a plant be cut over level with the surface of the ground, and consequently be deprived of its nourishment from the roots, it will, notwithstanding, remain alive, and its buds will continue to attract the sap from the vessels with which they are connected, and will expand into leaves. These, as well as others with which the cutting may be furnished, will continue to perform their functions almost as well as before the separation of the plant from its roots —that is to say, they will elaborate the sap till all that can be drawn from the cutting is exhausted. It will continue to form celluar tissues, and so long as this is formed, it will naturally flow along the proper channels as far as possible. It will descend from the leaf by the vessels in the petiole or leaf-stalk, and by the inner bark of the shoots, depositing secretions and forming woody tissues in its progress. It is not, however, usual for the tissues organized by the leaves to be wholly monopolized by the stem and its parts above ground, for whilst a certain quantity is thus appropriated a considerable portion passes on to the roots and adds to their growth and extension. If a plant be 3 feet in length from a certain part of a shoot to the extremity of the roots, the sap elaborated by the leaves on the part deposits more or less substance throughout the whole length of 3 feet; moreover, if the soil be in a favorable condition, especially as regards temperature, an extension of the extremities of the roots is effected. If a cutting 6 inches in length below the leaves is made, presuming it to continue its functions as usual, the cutting will receive and appropriate the share of elaborated sap due to a length of 6 inches, while the tissue not so appropriated, and which would have extended 30 inches further towards the extremity of the roots, accumulates where the channels of communication with the latter are cut off, i.e., at the base of the cutting. Here it forms a callus of organized matter, which, under favorable circumstances, protrudes and ultimately assumes the form of roots, and the cutting has become a plant. This result, however, depends upon various circumstances, to which it is necessary to advert. The cutting requires to be of the proper age, inserted at the proper season, and in a suitable medium, and should afterwards be kept in a well-regulated condition as regards heat, moisture and light.

Selection of Wood.

Cuttings should be taken from healthy plants, and from such parts as are not in a weakly state, for if the shoots or branches are not in a condition to make a fair growth with a supply of nourishment from the roots of the parent, they cannot be expected to possess sufficient energy when made into a cutting to make a good plant. At the same time, excessively vigorous shoots accustomed to receive an abundant supply of nourishment, are not so well able to keep alive, when deprived of that supply, as others that have been less highly fed. Some kinds of trees, such as the willow and poplar, strike from either the old or young wood; but most strike more readily and make the better plants from well-matured shoots from the current year's growth. In the case of hard-wooded plants which are difficult to strike, considerable nicety is required in selecting the portion of the shoot suitable for a cutting, the wood of which is neither too old and hard, nor too young and soft. In the former case, roots are not readily emitted, while in the latter the cuttings are apt to damp off. A knowledge of the proper degree of firmness which the cutting should possess can only be acquired by practice, especially as this differs in different plauts. When not exactly known, it is well to insert cuttings of various degrees of firmness, and observe for future guidance the condition in which they succeed the best.

IRRIGATION CANALS, DOS PALOS, MERCED CO.

Time of Taking Cuttings off.

The cuttings of hardy deciduous trees and shrubs should be made after the fall of the leaf, and before the sap rises in spring, as the sap is then in a condensed state. As it expands by the increased warmth of spring, the buds swell and the sap is returned to form callosities, and the more readily if placed in soil that is moist and warm. The worst time for taking the cuttings of this description is when the sap is in full flow, and when the leaves from the buds formed in the previous summer are just expanding. At this period they evaporate the moisture contained in the leaves with great rapidity, and at the same time return organized tissue but slowly, so that before enough of it to produce roots is accumulated the cutting is exhausted. As a general rule, cuttings should be taken off either when tne plant is in a dormant state, or when it is active and has made a new shoot, with leaves so far matured as to be in the act of forming an abundance of woody tissue.

Preparation of Cuttings.

Cuttings of gooseberry, currant and some other kinds of plants, emit roots not only from the callus at the lower end of the cutting, but also along the sides. In these and other kinds of cuttings from deciduous trees, the buds on the underground part must be cut, picked or rubbed off, otherwise they will sooner or later push into shoots, and produce an inconvenient number of suckers. It may be observed that in the gooseberry and currant the leaves have chiefly performed their office when the fruit has ripened, and as this occurs early in the season, cuttings made at this time and planted in warm, moist soil will form roots before the winter, and will consequently be ready for vigorous growth early in the ensuing season, and before cuttings of the same sort inserted in spring could have formed a single root; thus the cuttings made early in the autumn will be nearly a year in advance of those planted in spring. These illustrations are quoted as familiar examples of what may be observed and taken advantage of in regard to the propagation of other plants.

In such cases the leaves must be taken off, otherwise they will evaporate the moisture of the cutting. When plants are difficult to strike by the ordinary mode of cutting off a portion of a branch or shoot for immediate insertion, it is a good plan to ring the shoot below a joint about midsummer; the returning sap being cnecked, a swelling commences above the ring and continues to increase till active vegetation ceases in autumn. The branch should be cut off below tne ring and laid in the soil till spring, in order that the swelling may be softened by the moisture of the soil, to facilitate the emission of roots. In the spring the cutting is taken up and the ringed portion cut off close to the underpart of the swelling; the cutting is then inserted in the soil to the proper depth, the top having been previously shortened to a few buds above the joint corresponding to the surface. The cutting is left until the autumn, and then removed to its proper quarter.

With regard to the preparation of evergreen cuttings, and the importance of allowing the leaves to remain on the cutting, some people prefer leaving them all. I find, however, that by so doing the leaves remaining on the cutting have a great tendency to damp off, and cause decay. It is common among practical gardeners to cut with a sharp knife or a pair of secateurs, very neatly under the bud or joint, and remove three or four of the lowermost leaves, then cut the leaves across the top to avoid taking up too much space, and also to prevent damping off. Then take a box or pan about 4 inches deep, put a few holes in the bottom of it, place some pieces of broken pots, charcoal, ashes or other rough material over the holes for drainage and fill up, first with a thin layer of leaf-mould, and place above a light layer of a compost of two parts light loam, one part leaf-mould, one part sand, and one part well-decayed manure and a little powdered charcoal, well mixed together; finally, fill up with pure clean river sand, seeing that the sand is free from decaying matter, as otherwise it will induce putrefaction. The sand is porous, and affords a ready passage for the spongioles (i.e., the soft white ends of the rootlets), yet being fine it retains moisture by capillary attraction. The sand contains very little nourishment, and, as a matter of fact, very little besides what may be dissolved in the water is required till the rootlets begin to be formed. The sand should also be free from oxides of iron. After firmly pressing the contents of the box, take a pointed stick or what is known as a "dibber," and insert the cuttings, taking care not to injure the bark when making the cutting firm with the stick. When the box or pan is filled place in a cold glass frame and keep the frame shaded and fairly warm for a short time.

Cuttings of hardy plants which strike in the open air are sometimes inserted by means of a dibber, but it is always better, when circumstances will permit, to cut off by a line a straight edge in the soil, and place the prepared cuttings against it, pressing the soil closely around them. In preparing the cuttings for the open air, such as roses, ligustrums, and a great many other trees and shrubs, it is advisable, after the cutting is ready for insertion, to tie each variety in small bundles, make a hole in the ground deep enough to allow the cuttings to be turned upside down, and cover all 4 or 6 inches deep for a few weeks. This causes the cuttings to callus very much more quickly; as soon as they have formed this callus, take out and plant where wanted in tne nursery, at the same time being careful not to expose the cuttings to the sun. A piece of wet bag should be used to prevent this exposure, which will blacken the callus and spoil the cuttings. The callus will not stand pushing into the soil and a little trench must be opened out and the cuttings laid in gently.

Live Stock and Dairy

CORRECT FEEDING.

THE assimilation of food should be as good as the appetite. The appetite needs training or controlling in both directions—enough food—not too much. Excessives and semi-starvation produce equally depraved physical conditions. Animals as well as people, can become accustomed to living on starvation diet. While gorging is wasteful from excess consumption, starvation becomes equally wasteful from lack of productive returns. Starvation or rather the reduction of food supply to merely enough to keep alive, leads to tranquility and stupidity, for the functions of the body are lowered to a minimum, the output of every kind is reduced to the lowest limit, for life must be conserved. The results of abstinence to produce a saintly degree of stupidity was well worked out in the Middle Ages, under a guise of religion. The infinite leisure of the monks produced little of worth.

Balance.

The underfeeding of animals takes from them force and aggressiveness, as well as vigor. The dairyman well knows that the sire that sends his food supply into rich blood and nerve force is going to be a fighter. The best sires are, therefore, the mean ones; not mean from inherent original sin, but from vigor and force of good red blood flowing in their veins. The balance between overfeeding and under-feeding must be carefully kept. It is possible to develop the stuffing habit in a horse or cow. I have known cows that would eat ten pounds of grain twice a day and not be fattened or increase in the milk yield. The feeding of young stock is safer when on soiling crops, as the bulk is great enough to prevent serious over gorging. In feeding youngsters on soiling crops, once a day is enough if they have some picking of grass. In walking and browsing along, they grow better than on the standing around a full rack to stuff. The assimilation of food gathered slowly seems to be more thorough and they do not learn to gorge themselves. The man that ate so much that it made him poor to pack it around, is but an example of the folly of overeating. Cows can learn to take quantities of food and pass it through their system half digested.

Stored Food.

A great producing cow can store her food against the future milk flow. Take a cow that is a heavy producer of butterfat; let her go for a year or two without breeding and then breed and dry her off for a couple, yes, more than a couple, four, five or six months; feed her along on a good grain ration to hold her in good order. When she freshens, begin to feed as fast as possible. The official tests should begin at six days. If she has been a good producer before, she will make a record of seven to thirty days on the stored food. Some cows will even make a big yearly yield if handled in this way. While I do not mean by this to say that the records are not an advance to dairying, I do mean that many a cow that makes a great record is sold on that record to disappoint her new owners, because they do not understand how to feed her for the test. The registration of cows gain is possibly only from the cows having the blood to perform. The records gain their value when the same cows come back year after year into the records, not from the sprinters that make a forced record and then retire. This is merely jockey work in the dairy.

Inheritance.

Davenport in his Principles of Breeding, says of the race horse that no part bred horse defeats the pure bred one in racing speed. "Blood will tell" every time and when it fails the hand that directs the food supply is at fault. The cow, herself, is a poor judge of the amount of food she can use and will often leave the portion of her food needed to balance up ration. It is necessary to watch the mangers for the left over, as it is to watch the feed box for the full amounts. The experiment was made of taking a cow that had been fed carefully for years on rich food, and surrounding her with an unlimited amount of the various foods, oilcake, gluten meal and the rest to see how she would mix them into a ration. The experiment proved the cow had no more sense in her eating than human beings; one day she ate ten pounds of oil cake, the next day none. The result of this was costly, for the cow became worthless from overeating of the illy balanced ration.

Mothers.

The children today at the family table are allowed to pick and choose their food with the result that it is not uncommon to see a five-year-old child eating a quantity of rich food that is far too great for its tiny stomach. Simple food carefully balanced is needed for the child. Half the dulness of boys complained about in school really is from overeating, while the girls have the starvation fad and are equally hard for the teachers to hammer new ideas into their heads. Bad temperd children are often the result of excessive meat eating. Sweetnss of disposition in a child comes from the simple food, and bad tempers and stubborness from the badly abused little stomach. An old Irish woman was excusing her bad tempered boy by saying, "Yes! Johnny was such a nervous temperature." Johnny was a glutten.

Temperament.

The food of a dairy heifer must be in keeping with her temperament. She does not require the rich foods that the beef heifer can handle to advantage. The dairy animal consumes far more protein, the alfalfa and green peas. Oil cake is the resort of the dairyman to furnish this food cheaply to her. Oil cake is little needed in an alfalfa country for the regular run of the cows; special animals that are producing beyond the amount the alfalfa can supply should have oil cake as it is a more concentrated form of food. The owner of a fine race of dairy animals must give up all idea that he can hire the knowledge of feeding and breeding to bring out the best in the herd. The cows must be studied as a race and then as individual animals. Not once or twice but many times. I can sit and watch the heifers in the field for hours and slowly learn the type of the next generation—the points that are being exaggerated in that lot of youngsters, that are not desirable—until the understanding comes of what the sire should look like that is to be used on that generation. It is the daily watching and observing that brings results in the herd.

Jersey Cows.

The owners of this race of cattle in their native lands are all small holders. The skill with which they breed and increase the number is shown. Every year about 2000 are sold for export. The total number of cows and heifers in milking is said to be 6728, with 803 two-year-olds, 2266 one-year-olds, 2455 calves. This indicates a high degree reproduction. Think of the skill and care to keep vigorous these few head of cattle in a country where no new blood has been introduced for over 200 years. The dual purpose cow has no place on the Isle of Jersey. This old idea that a cow can serve two purposes, be a butter machine and yet produce a steer of feeding quality still lingers in the mind. The strangest part of this matter is that often the men most stubbornly wedded to this idea are men that have handled cattle for years. Why dairymen should persist in holding these views seems strange. The Shorthorn breeders of Kentucky look with scorn on a dairy bred cow. They exclaim that the introduction of the dairy breeds into the adjoining States has ruined the farmers' cattle. It has, too, for beef purposes. Milk is more than beef to many a man's pocket in this day.

Butter—Beef.

I have in my hand a letter asking if I can recommend some one that has butter beef cows for sale; I cannot, for I have never seen any of them. Sometimes a single cow may be found that will give milk enough for a family and throw a fairly good steer. She will not breed true to this purpose, no matter how she is bred—the results will be a heifer that will throw either to beef or to butter. The type is transitional, not fixed, as a characteristic.—M. E. Sherman.

"A JOKE."

In replying to a subscriber's inquiry as to possibilities of swine raising in California, the Denver Field and Farm says:

"The California hog market is a good deal of a joke as you have suggested. It is not so easy to haul fat porkers 2000 miles to market in a roundabout way over narrow gauge railroads, transferring to broad gauges and then sell the goods at Denver prices. Lux and Miller are raising hogs from one end of California to the other and so are other people."

If the California "hog market is a joke" it is a big enough one that California hog raisers are wearing the smile which won't come off. That "narrow gauge railroads" is also rich. "Lux and Miller" will doubtless be pleased to learn that their hog yard is 700 miles long.

If the office devil of the Field and Farm had read proof on that item he would have had intelligence enough to have thrown it in the hell box.

The editor is plainly away on his summer vacation.

WOMAN AND CYNIC.

Woman has the courage of her deficits; seldom of her defects.

The hair was given to woman long to give her an occupation.

The great advantage to man in marriage is that it protects him from his pleasures.

The petticoat in need is a petticoat indeed; however masculine a woman is, she reverts to the woman when necessary.

FARMERS' BOOKS
Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $1.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

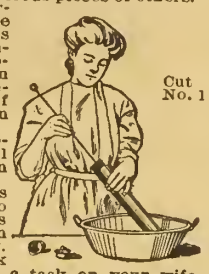
EXCLUSIVE
Tubular
ADVANTAGES No. 4
EASIEST TO CLEAN

The illustrations herewith tell the story of the difference in the amount of work required in cleaning the Tubular Bowl and the numerous pieces of others.

All dairy separators except the Tubular have bowls filled with complicated contraptions that make an endless and tiresome amount of labor in the kitchen twice a day.

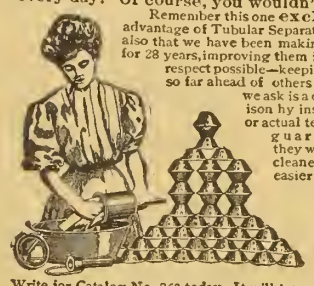
The 3-piece Tubular bowl Cut No. 1 can be washed in three minutes.

The other kinds are about equal to washing dishes for three dozen people twice a day.



Cut No. 1

Would you think of imposing such a task on your wife every day? Of course, you wouldn't.



Remember this one exclusive advantage of Tubular Separators and also that we have been making them for 28 years, improving them in every respect possible—keeping them so far ahead of others that all we ask is a comparison by inspection or actual test. We guarantee they will skim cleaner—are easier to clean—run easier or no sale.

SORGHUM AS A FORAGE PLANT.

During the past few years farmers have tried to raise feed that would lessen the expense of maintainging stock through the winter months and at the same time keep the stock growing in good condition, says a writer in Field and Farm. Corn is not a certain crop, so we have tried raising kaffir corn, millet and saccharine sorghum. Too many farmers and feeders plant their other spring crops and after they are through with everything else, say by the first to the middle of June, plant or sow the remainder of their ground to sorghum or millet. We can succeed in raising sorghum for feed under more unfavorable conditions than any thing else, yet to expect or deserve the best results we should use the same care and good judgment we give to wheat or oats.

We first plow and prepare the ground thoroughly; then use a twelve-foot press-drill, drilling from one and a half to two bushels of seed to the acre, from one and a half to two inches deep. Sometimes when rushed with work we use a seed sower attached to the rear end of a farm wagon and sow broadcast, then harrowing the ground thoroughly. This latter method is usually successful, but not as satisfactory as drilling the seed in, as the seed does not germinate so soon and a part is not covered at all. Enough seed should be used to have the stand thick like rank wheat or coarse timothy hay, thus making a fine feed for all kinds of stock.

In selecting seed three things should be carefully considered: First, select a kind that grows the most foliage and the strongest stalk. In this we have a fine feed and a variety that is most likely to withstand September winds until the crop has matured and is ready to be harvested. Combine in this the greatest per cent. of sugar. The weather is too hot in August and sorghum cut then usually spoils, becomes musty and unfit for feed.

GRUBS.

About this time many individuals of the genus Bos are making desperate efforts to reach the region along their backs with the tongue to quiet the terrible itching caused by grubs boring their way through the skin. These are the larvae of the gadfly produced from eggs deposited somewhere on the body and as development begins and it finds its way into the animal it finally appears under the skin on the back where it makes a hole through which it escapes. Like all parasites, it draws on the vitality of its host for sustenance. Cattle do not have grubs because they are poor, but are poor because they have grubs. The gladfly is not migratory to any great extent. The presence of gadflies on our home farm, and grubs on the backs of cattle were seldom noticed after a determined effort was made to destroy the grubs. This was done by squeezing them out—not a pleasant task—and also by the application of kerosene oil with a small oil can, letting a drop or two fall into the hole. This was a slow process, but was a well paid job, and one that any owner of stock may well undertake.

PURSLANE.

Purslane, or as it is more commonly called pusley, is regarded by most farmers as a troublesome pest. It has been noted by nearly everyone, however, that pigs when given access to it will eat it with avidity and when eradicating it in the garden or about the premises it would be well to collect all that is pulled and feed it in the hog yard and thus make the labor of destroying count in two ways.

It is usually not thought of as food for humans, but it has long been used as a salad and pot herb in Europe, and to some extent in this country. Inquiries as to its food value have led some experiment stations to make chemical analyses of the plant. According to the Indiana Station, green purslane has the following composition: Water, 86.56 per cent; protein, 1.81 per cent; fat, 0.5 per cent; nitrogen-free extract, 6.49 per cent; crude fiber, 2.12 per cent, and ash, 2.23 per cent. According to average figures corn fodder contains: Water, 79.3 per cent; protein, 1.8 per cent; fat, 0.5 per cent; nitrogen-free extract, 12.2 per cent; crude fiber, 5.0 per cent, and ash, 1.2 per cent. Of the value of purslane as a feeding stuff, the Indiana Station says:

Purslane compares favorably with average samples of corn fodder, so far as the protein and ether extract (fat) are concerned. Nitrogen-free extract is rather lower than in most green fodders, but the amount of water is considerably higher. The ash is higher than any ash we have seen reported in green feeding stuffs. Owing to the relatively low amounts of fiber and nitrogen-free extract, the nutritive ratio is high, being about 1 to 5.5. The material has been used to some extent in this State (Indiana) for many years as a food for pigs and in many localities is highly esteemed. Analysis show that it is well worth consideration as a feeding material for such animals as will eat it readily.

The Missouri Station studied the composition of purslane and also its ability to retain moisture. Young, vigorous plants free from blossoms were taken from the garden July 11 and suspended in one of the rooms of the station laboratory. In nineteen days (July 11 to 30) the plants lost 45.74 per cent water out of a total of 91.67, which they contained. No observations were made between July 30 and September 5, when some leaves were yet green, while the plants had developed blossoms and ripened an abundance of seed.

As stated above, purslane has been used for many years to a greater or less extent as a pot herb, being cooked in much the same way as spinach or beet tops.

THE MEANING OF PREPOTENCY.

We often use the word "prepotency" in speaking of breeding. It is a mysterious quality, suddenly showing itself in some sire or dam and then running low through two or more generations. It shows in plants as well as animals. The Bible speaks of the animals of the earlier creation that "each are brought forth after his own kind." The same law holds good in seeds. But occasionally we have a sudden assertion of breeding power in either that impresses itself on several succeeding generations and we call that a case of "superior prepotency." The following paragraph taken from Collier's Weekly is a clear comment on this much prized quality, one that animal and plant breeders are all the time seeking.

"The miracle of individuality which does not perish with the individual's passing distinguishes Kansas Sunflower Corn. Experiments conducted at the Kansas Agricultural Experiment Station by Professors Ten Eyck and Shoesmith show conclusively that of this species "the individuality of certain ears can be utilized in the improvement of a particular breed or variety. For after four years of successive tests it has been demonstrated that the high character of this one particular sort "traces back to two original mother ears."

"These ears did not show any great pre-eminence in themselves. They were not peculiar in their size or quality, but they had what only the growing of several successive generations could disclose—the power to contribute to their offspring certain qualities of yield, of early ripening, of resistance to disease and frost, which made the offspring of these ears pre-eminent by four hundred per cent above the other ears of corn. In all breeding work this phenomenon is sometimes noted The American trotting horse goes back to Messenger—not himself a great performer, but endowed with the Abrahamic power to sire a race of trotting colts preeminent in the world. So, in the race of wheat, Minnesota number 169 became the parent of a progeny which added from one to two extra bushels to the acre.

"The "Wealthy" Seedling of Peter Gideon furnished apples to all the Northwestern States—trees which would stand the long northern winter and ripen in the early fall. That parent seed—one of ten thousand planted by old Peter, had a character which was worth a million dollars in its potential yield; it had what the race horse, Mesenger, had, "the instinct to contest the race."

This is a good description of that wonderful quality of inheritance given by parent to offspring, that prepotent power we look for in all good breeding animals.—Hoard's Dairyman.

MORE MILK—MORE MEAT

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.
A. F. CHAPMAN, Monohan, Wash.

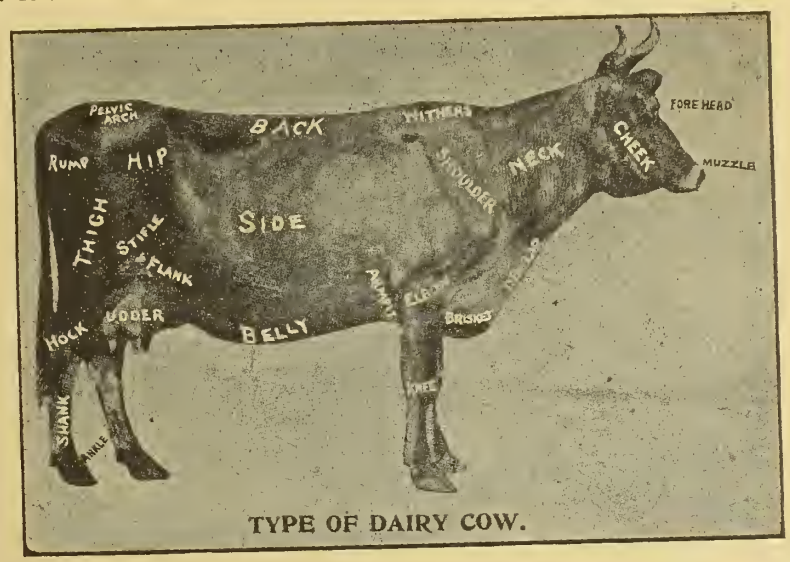
STUDY OF DAIRY FORM.

There is only one positive method of determining a cow's worth, and that by her actual record and the Babcock test and scales. But a study of dairy form is instructive and necessary in order that the cow's function may be understood and that we know how that function is performed. The purpose of the dairy cow is to make milk, and to feed and handle her properly for milk a knowledge of the principal organs employed is necessary. After studying the cow and knowing the work required of each part of her anatomy it will be realized that "dairy form" is the direct result of the activity of these parts.

The farmer, either in buying or rearing cows for use in the dairy, should make himself acquainted with what is known as the "dairy form," says a writer in Farmers Advocate. This form in its general characteristics will be found in almost every good milk cow.



TYPE OF DAIRY COW.

The following table is the scale of points for the dairy cow:

	Perfect score
GENERAL APPEARANCE	
Form, inclined to wedge shape	6
Quality, hair fine, soft; skin mellow, loose, medium thickness; secretion yellow; bone clean, fine	6
Temperament, nervous, indicated by lean appearance when in milk	6
HEAD AND NECK.	
Muzzle clean cut, mouth large, nostrils large	1
Eyes large, bright, full, mild	1
Face lean, long, quiet expression	1
Forehead broad	1
Ears medium size, yellow inside, fine texture	1
Horns, fine texture, waxy	1
Neck fine, medium length; throat clean, light dewlap	1
FORE QUARTERS.	
Shoulders light, oblique	2
Withers lean, thin	1
Legs straight, short; shank fine	2
BODY.	
Chest deep, low	10
Girth large, with full fore flank	10
Barrel, ribs broad, long, wide apart; large stomach	2
Back lean, straight, open jointed	2
Loin broad	2
Navel large	2
HIND QUARTERS.	
Hips far apart, level	2
Rump long, wide	1
Rump or Pin bones high, wide apart	1
Tail long, slim; fine hair in switch	4
Thighs thin, long	2
Escutcheon, spreading over thighs, extending high and wide; large thigh ovals	20
Udder long, attached high and full, extending far in front and full, flexible; quarters even and free from fleshiness	5
Teats large, evenly placed	5
Mammary veins large, long, tortuous, branched with double extension; large and numerous milk wells	2
Legs straight; shank fine	100
Total	

Milk can come only from the food the cow consumes. The food is taken into the stomach and digested according to the same general laws of digestion of other animals. When digested, the essential constituents of food are in condition to be taken by the blood and carried to those parts of the body best qualified for its use. Since milk is a product of the blood, an abundant milk supply depends upon an abundance of blood-making material, which must come from the food the cow consumes. Therefore a large quantity of food must be consumed by the large milk producer. A large stomach is, therefore, one of the essential requisites of the dairy cow and, aside from a large udder, is the most striking characteristic of the dairy form."

ALFALFA PALACE IS PLANNED.

While "corn is king" alfalfa is undoubtedly "queen" in the western States, and to his queen, King Corn is to build a palace in Omaha which will be one of the special features of the National Corn Exposition to be held there December 9 to 19.

The "Alfalfa Palace" is being planned by the directors of the corn show because of the increasing interest in the crop and its growing importance as a food for cattle. The palace is to be built of bales of alfalfa and lined with exhibits of alfalfa and other grasses. Valuable premiums are to be offered for the best types of the alfalfa plant, and many growers will secure hay presses and modern machines for baling the alfalfa.

Much attention is to be given alfalfa at the National Corn Exposition as it is now recognized that it is necessary food for stock. The best authorities have demonstrated that cattle cannot use to advantage all the carbohydrates and oil in corn without a protein ration. It is a waste to feed straight corn to stock in preparing them for market, and the big packing houses are now paying better prices for the stock fattened on a mixture of corn and alfalfa.

Then the mixture is cheaper. Few feeders are still of the opinion that they can afford to feed straight corn worth 60 to 65 cents per bushel to cattle for which they receive from $6.50 to $8 at the outside. For this reason those interested in agriculture are to secure exhibits and give demonstrations of interest to every grower or feeder of alfalfa, when the big palace is opened at Omaha in December.—Hoard's Dairymen.

A SKILLED PHYSICIAN.

"Faith, he's a moighty foine docther. He attinded O'Pheelan whin he was sick av th' appindicutis. 'Poke out yez toongue,' he says; 'bedad, Oi'll have th' opprate on ye,' he says. 'Divil a bit will Oi be oprated on,' says O'Pheelan. 'Then yez'll be a dead man b' 2 o'clock,' he says. So he opprated.

"An' saved O'Pheelan's loife?"

"An' saved O'Pheelan's loife—wan hour. He died at thray."—Kansas City Journal.

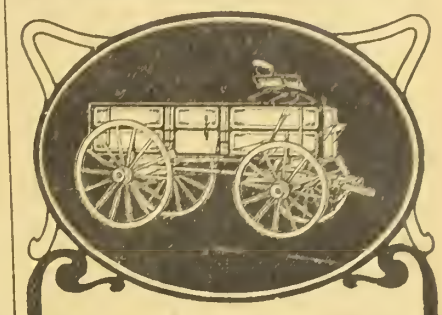
LONG SERVICE



FARM WAGONS

THE wagon that breaks down and has to go to the repair shop every once in a while is not a good wagon to buy.

Such a wagon is a poor one because it is poorly constructed, and because it is made from poor and improperly seasoned material. It is dear at any price.

In the building of Weber and Columbus wagons there is always a rigid observance of these four indispensable requisites:

1. Proper wood materials,
2. Thorough seasoning,
3. Superior ironing,
4. The best of skilled workmanship.

These are the things which have built up the excellent reputation everywhere enjoyed by

Weber and Columbus Wagons.

The New Bettendorf Wagon has steel gears which make it a wagon for any climate, and practically unbreakable.

Strength and durability should be first considerations when you buy a wagon. The Weber, Columbus and New Bettendorf wagons can be relied upon for long, satisfactory service. They are built to haul heavy loads and to stand the rough usage to which farm wagons are always subjected.

These wagons are in the front rank of high-grade wagons.

With all the strength and durability of these wagons, they are not made excessively heavy. They are noted for their light running qualities.

International local agents will be glad to show you these superior wagons and furnish catalogs with all desired information. Call and take the matter up with them or write to nearest branch house.

THE RACE TRACK EVIL.

It is said that there are only four tracks in the United States at this time at which gambling is openly permitted. Of these four two are in the State of California. One of them, Emeryville, is just across the bay from San Francisco and the other at Arcadia in Los Angeles. The business interests of the State are awakening to the fact that these two institutions are proving a menace not only to many young men, but to the interests which they represent, through its undermining influence. District Atorney Everett Brown of Alameda county in a recent address at Oakland said:

"I come to you as one who has rubbed elbows with the men who are filling our penitentiaries, and what I say to you is the crystallization of a long trend of thought upon the evil effects, as I have seen them, attendant upon racetrack gambling in this State, and especially at Emeryville.

"Over 60 per cent of the men confined in our State prisons are under 28 years of age, and it has been my personal experience to see many boys under the age of 20 sent to prison, labeled forever as felons. Is it not important for us to stop and consider one of the principal causes that are sending our young men to the penitentiary?

"You can turn to Section 300 of the Penal Code, which deals with prohibition of gambling. You will find a great many forms of gambling mentioned therein, but not a word about selling pools at the racetrack or in connection with racing.

"I tell you there is only one place to reach the root of this evil and kill it and that is the fountain head of the law making power of this State, the State legislature, and if there is going to be a law against racetrack gambling it will have to be secured by the efforts of the people of California.

"If you had been with me during the last few years and seen bright, manly looking young men standing before the bar of justice charged with felonies; if you had gone with me to their cells in the county jail and talked with them about the causes which brought them to their pitiful plight, you would have found them reaching back to yonder racetrack at Emeryville.

"Gambling incident to your race-track is reaching every walk of life, the rich, the poor, the high, the low, the man, the woman, the old and the young. In some of the stores around the bay, during the racing season, money is collected from the clerks, both men and women, some of whom receive as low a wage as $6 a week, in sums of 25 and 50 cents a day, to be played on the races, either at the track or in many gambling dens that are located right within our cities."

TIDY UP.

There are many beautiful homes places in California. Not only is the residence itself tidy and comely, but its grounds and all outbuildings are built and arranged in a way which indicates a desire on the part of the owner to have things attractive as well as to have things planned so as to have the greatest utility. This is because many California farmers have not only a liking for these things but being business men know that such attractive and convenient buildings and appliances are of commercial worth in accomplishing the work of the ranch.

But unfortunately too many of our ranchers do not appreciate this worth, and valuable machinery is sometimes allowed to rust in the open, subject to sunshine and rain until its life is shortened and direct loss is sustained. This loss is sustained not only because of the machine which is injured or lowered in productive capacity, but also in the impression which is given to the passer by that a community filled with shiftless farmers is not a desirable community in which to live.

Imagine for a moment an Eastern capitalist or professional man looking over the land with an idea of securing a desirable acreage for a home in which to spend the remainder of his life, riding along a roadway lined with dilapilated farm buildings and ill-kept surrounding, and it will be quickly seen that such a sectlon will not appeal to him for a moment. He not only expects to buy the acreage on which his own home is to be erected, but as well to buy attractive approach to his place and enterprising up-to-date neighbors. We all do that though many of us unconsciously. These surroundings, churches, schools, pleasant society, all have a value. Let the farmer of this State bear these facts in mind and draw an attractive class of people about him. His own property will become more valuable; the society of the neighborhood improves until the young people of the ranch will apreciate the worth of the neighborhood and be more content to remain with the farm.

A TRIBUTE.

"The countless millions of population are fed and clothed by our American farmer.

"The grain waving in golden beauty upon the great plains of the West, the cotton, drlfting like summer snow upon the fields of the South, freight the fleets of nations and loose their sails, thread the continents with tracks of steel, fill the earth with the roar of trains and heap for trade and commerce and useful art those stores that make a nation great.

"Where are the sinews of our strength if they are not found in our great, diversified agricultural products? What victorious hosts ever waved as joyous banners as those that float above the tasseled maize from the snows of Maine to the spicy groves of California?"—E. S. Chandler, Mississippi.

Do you like fruit? Then take better care of your trees.

LEMON INVESTIGATIONS.

We are pleased to note that G. Harold Powell and his corps of assistants are to take up the investigation of lemon decay and disease, meaning, if possible, to prevent the present heavy loss to lemons in transit. Mr. Powell has given a great service to orange men. We believe he will give equally as great to the lemon shippers.

In a letter to this office Mr. Powell says:

During the past few years many of the largest organizations connected with the lemon industry have requested us to extend the type of investigation that has been carried on in connection with the orange to the handling of lemons. It has not been practicable to undertake this work, as all of the available men have been connected with the orange investigation. As the questions relating to the losses in the shipment of oranges are nearing completion, it is our intention to take up the lemon industry from this time, and an effort will be made to determine the relation that the various methods of handling the fruit bear to the decays that occur in curing and in shipment. As with the orange industry, we will investigate primarily the effect of the physical handling of the lemon in the field, in the packing house, and while in transit on the common blue mold decays. Other forms of decay caused by parasitic organisms will be left for investigation by Prof. Smith and his associates at the laboratory at Whittier, where the equipment for this line of work is especially well developed.

We have two men in Southern California this summer working on the lemon, and several others will be added to the force in the spring. We are planning to carry on the work in many sections from San Diego to Tulare county, and to include demonstration experiments in the packing houses and extensive shipping tests.

In addition to this line of work, an investigation of the influences of the different methods of handling and of preparing the lemon for market, such as curing, sweating, etc.. on the physiological activities or ultimate keeping quality of the fruit is progressing under the direction of Dr. R. H. True of the department. This work will be continued and enlarged during the present year.

The various lines of work that are being developed by the department are planned so as to harmonize with the investigations that are in progress at the Whittier laboratory, so that the results of all of the investigations may be made to dovetail and to be generally helpful to the industry as a whole.

HOW ARE YOUR ANTS.

Entomologist Woodworth of the State University writes to the Cultivator that the Argentine ant has recently gained a foothold in at least four localities in the State.

It is much more persistent and annoying than any of our native species, besides being a great menace to horticulturists. Wherever they occur, lines of these ants can be seen going up and down the trunks at nearly every tree in the neighborhood.

It is suggested that all who observe any case of ants which have become unusually troublesome will do well to send specimens tc the State University entomologist at Berkeley.

Shop Talk

CAMPBELL'S SOIL CULTURE MANUAL—This week we would sugest to those interested this popular work. We are able for a short time to give absolutely free a year's subscription to the Cultivator with an order for the book at the regular price of $2.50. This is certainly an opportunity to get this valuable publication and at such a price that every western farmer can well afford to have it. Mr. Campbell is the originator of the Campbell system of dry farming and has demonstrated its worth in semi-arid sections. This 1907 manual is a complete guide along this line, and California ranchers can obtain valuable suggestions from it. Order through this office with either a renewal or new subscription.

FARM NAMES—The farm names are coming in. This week shows another installment. It is a small list that will grow larger as the weeks go on. Establish your farm name in the minds of others. Put up the name at the entrance, see that your local paper mentions it and let the Cultivator help along by proclaiming it to the State.

Agricultural Notes of the Pacific Coast

Northern California

Tehama county apricots are freer from shot-hole fungus than formerly.

Sutter county supervisors say that the State dip fails to cure scab of sheep.

One day's shipment of wool from Live Oak, Sutter county, aggregated 12,000 pounds.

Red Bluff, Tehama county, reports pear blight much less destructive than for twenty years.

The hop picking machine being tested near Gridley is more successful than anticipated by most hop growers.

The pet bull which suddenly turned vicious nearly claimed another victim at Woodland a couple of weeks since.

Owing to breaking of a flume near Chico, many orchards are suffering severely from the lack of irrigating water.

Standing on a sightly knoll in Live Oak, Sutter county, five combined harvesters were recently viewed in operation.

Drainage District No. 1 of Butte county recently held an election on the question of bonds for improvements in the district.

Fruit growers near Red Bluff, Tehama county, are concerned over quite an extensive appearance of cottony-cushion scale.

United States Reclamation Service is experimenting with the sinking of a well on a 10-acre tract near Davisville, Yolo county.

The Shasta County Board of Supervisors has passed a resolution granting a scalp bounty of $2.50 for all coyotes killed in the county.

A combination of automobile on one side and trolley car on the other resulted in the death of a horse which was literally frightened to death.

Buyers of apricots at Chico have attempted to buy the present output of dried cots at 5¾ cents. No growers are as yet anxious to sell at such figures.

Quite a large element of farmers near Davisville is appealing for the separation of the University Farm from the management of the State University.

The crop of hops on Bear River promises to be exceptionally large and the recent warm weather has ripened the crop so rapidly that picking is beginning.

No wool sale is to be held in Ukiah this year as the market is so flat. This spring's clip with the last fall clip is much of it held over and will be kept in storage.

The long period of cold weather and the late frosts of spring injured the grain and even the grass crops of Sierra county, so that they will be very short this year.

An experimental planting of tobacco at Marysville, Yuba county, is proving very satisfactory the plants having grown exceedingly well and being now nearly ready for the harvest.

An active campaign which had been begun on the Russian thistle at Chico, Butte county, has been called off by the district attorney, owing to tne ruling that the charge cannot be legally made against the county. The pest is said to be doing great havoc near Chico.

Central California

Fresno county apricots have all been harvested.

Porterville recently shipped 6 cars of stock to Los Angeles markets.

Fresno county pear orchards show remarkable freedom from blight this season.

Citrus growers of Tulare county are appealing for more stringent quarantine laws.

The Soquel district near Watsonville has one of the largest granges in the State.

Santa Clara valley is issuing a booklet describing the advantages of that community.

A syndicate has bought 720 acres near Tulare which will be planted to eucalyptus trees.

The Visalia sugar factory recently made a record run of 8000 pounds of sugar in 24 hours.

Turlock, Stanislaus county, is to make a fight against Russian thistle which is appearing.

Watsonville, Santa Cruz county, will have one of the biggest grain crops in its history.

One ranch in Salinas valley, Monterey county, will this year yield 100,000 sacks of fine barley.

Nearly 1000 acres of wheat were destroyed by a grass fire near Hollister, San Bernardino county.

A special berry train leaves Watsonville for the San Francisco markets every evening at five thirty.

Producers near Modesto, Stanislaus county, are discussing the matter of co-operative marketing association.

The Fresno Chamber of Commerce proposes to take up the fight for continuation of present tariff on raisins.

Professor E. J. Wickson will open the Tulare County Fair with an address on the evening of September 21.

The manager of South African Fruit Company is investigating fruit growing methods in the Santa Clara valley.

A farmer at Visalia who had been exasperated by continual stealing of his melons filled two boys with birdshot one night.

General headquarters for the apple business of the Earl Fruit Company are to be transferred from Sacramento to Watsonville.

Kern County Land Company is considering the question of planting sugar beets on their land between Famosa and Wasco.

A big irrigation project fathered by San Francisco capitalists is being promoted in the southeastern part of Santa Clara county.

An inspector of the United States Bureau of Animal Industry is looking over the cattle and sheep industries of Monterey county.

Stanislaus potato producers have grown a bigger corp of potatoes than ever before, but are disappointed in returns owing to low prices.

The packing house of the Fresno Home Packing Company at Selma was recently destroyed by fire. In it were over 400 tons of raisins.

At a recent meeting of the San Jose grange, co-operation was the principal subject of discussion. Parcels post and postal savings were both endorsed.

Southern California

Orange county will produce 200 tons of honey this year.

Hay is selling at $15.00 per ton f. o. b. at Newport, Orange county.

Redlands has two new orange packing houses ready to begin the coming season's packing.

Imperial valley is raising the greatest output of Kaffir corn it has ever had, nearly all of which is fed to hogs.

Ranchers of San Marcos, San Diego county, are to set apart a certain day for general poisoning of ground squirrels.

Orange county has its largest crop of apricots to market with a serious scarcity of workers for the fruit cutting.

With heavy shrinkage in the output and more careful grading, Imperial cantaloupes are commanding better prices.

Truck farmers of Southern California and, in fact, of the whole State are disappointed in market conditions this year.

Redlands, San Bernardino county, has a tree commission, the duty of which is to look after the shade trees of the city.

Imperial hog raisers are happy over the recent increase of one cent per pound on pork. They are now receiving 6½ cents.

Ventura apricot growers have agreed upon a price of eight cents a pound for dried fruit and fifteen to twenty dollars per ton for pits.

Counties of Southern California in which forest reserves are located will hereafter receive 25 per cent of all revenue from these reserves.

An effort has been made by residents of Coachella valley to set on foot a movement by which they may retain Salton Sea at a uniform level.

Hay growers at Lompoc, Santa Barbarba county, have secured a reduction of $1.00 per ton, from $3.50 to $2.50, on freight rate to Santa Barbara.

The Newbert protection district along the Santa Ana river in Orange county is still in a legal tangle over raising the necessary funds for improvements.

Imperial valley has made experiments this year on broom corn and one grower near El Centro has demonstrated the suitability of that crop for Imperial valley land.

Fruit growers of Escondido, San Diego county, have recently organized a fruit growers association to build and equip a packing plant and pack, ship and market fruit of the members. The board of Directors reecntly elected is made up of the following gentlemen: A. W. Wohlford, W. L. Ramey, W. D. Wooldredge, W. W. Prior and Albert Beven.

An informal meeting of a large number of apricot growers of Ventura was held recently, the object being agreement upon uniform prices of dried fruit and pits and the formation of a permanent organization which might ultimately lead to State organization. A committee of five was chosen to work up the matter of organization: A. L. Shively, Geo. W. Fleisher, Carlyle Thorpe, John Burson and H. Proctor.

The Coast

Hay cutting at Moscow, Idaho, has begun.

Over 100 carloads of cherries were shipped from Clarkston, Washington, this season.

Idaho wheat crop will be exceptionally good this year.

Gainsville, Idaho, is shipping large quantities of fine cattle.

Utah claims this will be the banner fruit year of her history.

Stockmen at Lewiston, Idaho, are ready for big round up of cattle.

Cheney, Washington, celebrated July 4th by holding a horse show.

There are fifty dairies on the island of Oahu on which the city of Honolulu is.

There are over 200,000 acres of sugar cane planted on the Hawaiian Islands.

The dairy industry in the Palouse country, Washington, is rapidly increasing.

The Health Board of Pendleton, Oregon, is making a campaign against diseased cows.

Farmers at Walla Walla, Washington are unloading hold-over crop of last year's hay.

The Agricultural College of Utah has just completed five weeks' agricultural session.

First full carload of cherries out of North Yakima, Washington, was forwarded this year.

Fruit growers near Portland, Oregon, will market this season more than 50 cars of loganberries.

The annual meeting of the Oregon State Horticultural Society will be held at Portland in December.

Flood of strawberries in the Spokane markets last week reduced prices below cost of production.

The annual meeting of the Pacific Coast Nurserymen Association was held in North Yakima, Washington, last week.

Citrus fruits are being cultivated quite extensively in Hawaiian Islands, but not sufficiently to supply home consumption.

Astoria & Columbia Railroad has installed an oil grass burner for destroying weeds and grass along its right of way.

Grain growers of eastern Washington have found a wonderful improvement in their grain crops by proper seed selection.

The Lincoln county fair, recently closed at Davenport, Washington, has paid all expenses and still has money in the treasury.

Offerings are freely made at Portland in quoting 10 cents for coming hop crop, with farmers not anxious to sell at that price.

Over 3000 acres are now planted to pineapples in Hawaii, and it is estimated that in a few years this will aggregate 10,000 acres.

Dayton, Washington, has just completed an irrigation plant which will be the cause of subdivision of a large tract of land into small holdings.

A new pest has developed in the wheat fields of Plaza, Washington, which stings the stalk, or deposits its eggs witnin the stalk, which soon decays and breaks over.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Coulson's Cresolene

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times it own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company
Petaluma, California
Germain Seed Co., Los Angeles, Distributing Agents for So. Cal.

Little Chicks should be fed on **Excelsior Chick Food**

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

Excelsior Cereal Milling Company

242 Central Ave., Los Angeles

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

RELATIVE VALUE OF DIFFERENT BREEDS.

PROF. JAMES DRYDEN, who for several years was in charge of the poultry experiments carried on by the Utah Agricultural Experiment Station, has the following on this subject:

"Which is the most profitable breed?" Is a question that is more frequently asked probably than any other connected with the poultry industry. It is one, however, that a peaceably inclined man hesitates about answering or expressing an opinion upon. However the writer ventures to give the results of several years' experiments with different breeds at this station, believing that they are of value as tending to show characteristic differences in egg laying capacity, the relative merits, of course, of the different breeds cannot be accurately or definitely determined by any series of experiments, but they may serve to indicate some of the characteristic differences of different types of fowls.

Our experiment shows pretty conclusively, that so far as egg production is concerned the question of breeds is subordinate to the question of individuality. There are good and poor layers in all flocks and the range between the good and poor is very great. The records of the station show a range of from no eggs a year to 242, and as far as these records show all breeds are alike in this respect. The difficulty in selecting the good layers of the flock for breeding purposes is probably the cause of this condition.

POULTRY BREVITIES.

A method for preparing Douglass mixture was given in a recent issue of the Cultivator.

* * *

For good winter laying and for fine frying chickens, there are no better breeds than the American varieties.

* * *

So far as egg production is concerned, the question of breed is subordinate to the question of individuality.

* * *

Gapes is a disease that shows itself in chicks between the age of six and eight weeks and not generally after four months.

* * *

When fowls come from rugged stock and are kept under sanitary conditions there will be but little sickness among them.

* * *

Better drop a few drops of carbolic acid in the drinking water these days. It is through the water that roup is spread. If you have not the acid Douglass mixture will do. In fact, some prefer it.

* * *

The long, hot summers of California furnish ideal conditions for the rapid multiplication of all kinds of vermin which prey upon poultry. Disease germs are more numerous and develop much faster than in a colder climate.

* * *

An excellent disinfecting spray for poultry houses is made by mixing one-half gallon of crude carbolic acid and one-half gallon of phenolene and adding twenty gallons of water. A house for fifty hens can be sprayed at a cost of about two cents for material.

* * *

We often meet the term in poultry literature "thoroughbred poultry." There is but one animal to which this term is properly applied and that is the English race horse. The proper term that should be used in speaking of well bred poultry is standardbred or purebred stock.

* * *

Feather Eating.

Will the Cultivator give a remedy for hens picking feathers from one another. I have 20 hens. Those hens are kept in a small yard but everything is kept as clean as possible. Some of them are picked nearly bald by their mates. Is this due to lack of something in the food? We feed corn, barley and wheat mostly. The hens have oyster shell before them at all times and for green stuff we give them beets, cabbage and small potatoes. Have fed some alfalfa meal.

Is alfalfa meal a good substitute for green food? And what is the best method of feeding it? What can we afford to pay for it for poultry food?—K. M.

This feather eating vice is mainly due to lack of occupation. After hens have once formed the habit it is almost impossible to break them of it. I have found Leghorns when confined more liable to form the habit than other breeds. There are several possible remedies. One is to furnish occupation by feeding grain in the litter that they may have occupation in scratching for it, and feed plenty of beef scrap in a separate hopper, that they may have all they care for. Another is to cut off the ends of their beaks shaving off the hard part of both upper and lower mordible, but not enough to make them bleed. They can still pick up food. but cannot pick a feather hard enough to pull it out. If the owner is so situated that he can let the flock run at large, that of itself is one of the best remedies.

Alfalfa meal makes a very good substitute for green food providing it is made from good material, i.e., hay made from alfalfa cut not later than early bloom and well cured. More or less of the alfalfa meal is made from hay that has been overripe when cut, cured by long exposure to the sun, consequently the meal is of a very inferior character.

Good alfalfa meal has a composition similar to that of good wheat bran. What one can afford to pay for it depends on the price of poultry foods and other conditions. If one is feeding alfalfa hay, the leaves that drop off and are scattered on the floors and in the cribs may be fed to the poultry and the expense of alfalfa meal avoided, as these leaves are equally valuable as food. Again a bale of alfalfa hay may be bought cut into one-fourth-inch lengths in a cutter and fed either soaked or dry. Hens do not always take readily to alfalfa meal and it is well to feed it in small quantities at first mixed with bran or other ground food.—S. S. T.

* * *

Lice.

Will you kindly tell me what will rid little chicks of lice? The chickens have new houses and coops, all of

which are saturated with coal oil, as are the nests and legs of the hens. There is plenty of dust handy also. None of the chickens, large or small, are shut up—they have the run of the ranch. But they are dying off rapidly from lice, even though I've put coal oil and lard on the heads of some of the little ones.—Mrs. G. W. H., Reedley.

Paint the inside of a barrel with some of the liquid lice killers, the fumes of which are destructive to lice, (there are several on the market) put the chickens into the barrel and follow directions. If you do not care to use this method, dust the birds with some good insect powder.

In the meantime clean up the houses and coops, removing all litter, and spray with kerosene emulsion, containing crude carbolic acid (one pint to two gallons of emulsion). For ridding the houses and coops of the pest, this treatment must be repeated once a week until three applications have been made. Paint the supports of the roosts and the underside of the roost with crude oil. The head lice may be killed by greasing the head as you have done. The louse breathes through the openings in the body walls and consequently is suffocated by the grease. Sitting hens should be kept free from lice during incubation and while brooding the small chicks.

This is readily done if taken in time. Carefully dust the hen and give her fresh material at the time the eggs are put under her. This material should be mixed with tobacco stems which can be bought at a low figure, as cheap tobacco is carried by dealers and used for sheep dip. If you cannot secure tobacco sprinkle the nest with sulphur. The heat and moisture of the body converts the sulphur into compounds that are deadly to lice. Dust the hen every week while sitting and there will be little trouble in keeping chickens free. When the chickens come off and the hen is dusted rub a little grease or vaseline under the wings. Lice getting into this grease are destroyed. Better results will follow if the dusting be done at night.—S. S. T.

* * *

Grit.

Editor Hunter of Farm Poultry has the following to say regarding the value of grit in a poultry ration; we insert it as he is one of those writers on poultry subjects whose opinions are worthy of careful consideration.

A reader calls our attention to an article by Dr. J. L. Short in the American Poultry Journal, in which this statement appears: "I shall oppose the popular and absurd idea that chickens require gravel to grind their food. This notion has attracted my attention for years, and the more I think of it the less credit I give it. How strange that nature in her wisdom, power and completeness would create a beautiful and useful bird and neglect to complete the important means of digesting its food!"

Our reader suggests that we "trim this fellow up." We're sorry we can't accommodate him. Fact is, the writer is very much inclined to the same opinion, and has repeatedly expressed it in these columns. It has not yet been demonstrated that grit—an indigestible, sharp edged substance—is essential to the fowl's digestion. The presumption that it is is absurd. The fact that fowls swallow grit, often eagerly and sometimes in considerable quantities, does not prove that it is a necessity. It is more reasonable to suppose that the instinct or impulse to eat grit is prompted by the appetite seeking for some mineral matter that may prove digestible. We do not regard it as proved that in grits which seem to be in part digestible, the indigestible portion is of any value to the fowl. Our own observations on the use of grit seem to us to indicate that when fowls in confinement and fed by man appear to need and be benefited by the mechanical action of grit in the digestive system, it is because of conditions which would not occur in nature.

A good cure for the idea that the gizzard of the fowl needs the assistance of grit to perform its functions is to test the teeth on the grinding or more properly "rubbing" surface of a gizzard, and then try to imagine what article of the food of fowls could not be reduced to pulp by so muscular an organ, after having been put through the processes of the crop and proventriculus or stomach proper.

SKIM MILK AS POULTRY FOOD.

On nearly every farm where poultry is kept there is more or less skim milk, and no better use can be made of it than feeding it to chickens. It probably gives best results in the ration of young chickens. It is true that the fat has been removed, but the most valuable food constituents, i.e., the nitrogenous substances, are left behind in the skim milk. The growing bird demands a food rich in this substance, and at the same time it must be in a form easily digested. Skim milk meets the requirements. It can at all times, to advantage, form part of the ration of chicks or laying hens. The Indiana Station made some interesting investigations on the use of skim milk for young chicks. Two uniform lots of chicks, ten each, were fed from July 11th to September 5th, under similar conditions, except that one lot in addition to the food eaten had all the skim milk that they would drink. Both lots were given all they would eat of a mixed food consisting of two parts crushed corn, one part bran and one part ground oats. They were fed three times a day. In addition they had cracked bone, cabbage and lettuce. It was found that the lot receiving skim milk, ate more of the mixed food and gained more rapidlly than the lot that did not receive skim milk. The milk-fed chickens made an average weekly gain of 4.46 ounces; those receiving no milk 2.62 ounces. The investigators considered the milk especially valuable for young chickens during the hot, dry weather; it becomes less important as the chickens grow older and the weather cooler. The dishes in which the milk is fed should be frequently scalded.

Half-hearted effort will never bring success in poultry raising or any other line of endeavor. If you expect to accomplish anything worth while you will have to be an enthusiast and get a hustle on you. If we could raise prize winners or extra heavy layers without giving any special thought to mating or care in rearing the fowls, what encouragement would there be for the fellow who works hard?

When a sick or droopy fowl is noticed, and there is a doubt about what ails it, a good family liver p... is the safest treatment, and the chances are it is just what is needed.

It's the under part of a hen's body that has no protection. All wet soaks in and chills the hen, thus causing most ailments.

FEED YOUR PULLETS

As well as your Laying Hens, on

Coulson's Egg Food

It will bring them to maturity in health and vigor and ensure you lots of eggs in the Fall when prices are high. It can be fed moistened as a mash, or dry in hoppers. Manufactured only by

Small Fruits and Vegetables

GROWING GARDEN BEANS.

In planting garden beans, make shallow drills with hoe from ten to twenty inches apart, plant the seed about four inches deep, says a writer in Successful Farming. For a succession of string or snap beans the seed may be planted every two weeks up to September with early dwarf varieties although in the home garden the best yield is obtained from the tall or pole varieties, and they are far less liable to attack from disease and insect pests. Some of them are of better quality and continue in good condition for a longer period. Cultivate as soon as plants are up, continue providing soil mulch until plants begin to blossom. Then a slight ridging or hilling sufficient to keep the stems and roots from injury by the sun is all that is necessary. While hoeing or cultivating should be carried on at regular intervals care should be taken not to hoe in wet weather as moist soil thrown on the leaves increases the liability to spot and blight.

RASPBERRIES AND BLACKBERRIES.

These berries, all of the genus Rubus, are cultivated in all lands and to the extent of approximately $10,000,000 annually in the United States. The number of species of blackberries and raspberries actually in cultivation is somewhat larger than with most fruits but still quite small. On the other hand the number of wild species of these berries is very great, and the qualities and types of these

SOME PUNKINS.

Anthracnose is a fungous disease and may be kept in check or rather prevented by spraying vines with Bordeaux mixture. In wet weather the disease spreads rapidly, and owing to its prevalence the wax varieties are not planted so largely in some localities, as they were even a few years ago. The green podded sorts are less liable to be attacked, and when attacked the disease does not spread so rapidly. The best plan is to plant in succession as the disease may be prevalent one week and another week lose its force.

Cut worms are the worst insect pest and may be guarded against by thick planting, and by using the poisoned bran remedy, and practicing thorough cultivation.

Pole beans differ from dwarf sorts in the method of planting; they may be sown either in hills or wide shallow drills. I have tried both plans, but have settled on a variation of the methods which I call the hill in row system. A line is stretched the length of the row and the soil removed to a depth of three inches if already manured; or if not place three inches of manure beneath the same depth of soil. These hills are about two feet apart from center to center; in each one the beans are then dropped in a circle eight to twelve being about the right number, which, if too thick after coming above ground, may be thinned to the best formed plants. As soon as they are well up the soil is kept stirred and in a few weeks they may be earthed up by the soil being drawn about the stems. As soon as they begin to run, poles may be set in the center of each hill. Set deep, use a bar to make the hole and incline poles at a slight angle, not only to enable vines to climb easier, but to permit the sun to gain entrance. In picking, only the tender green pods should be taken, and none allowed to mature seed, as it checks the productiveness of the vines. Pole lima and varieties grown for shell beans may be allowed to mature, the only difficulty being in gathering and separating from poles.

wild forms are many and valuable. There have been over 800 species of Rubus described, and some of these wild berries are superior both in size and flavor to many forms now under cultivation. One species of wild raspberry is known with fruit nearly or quite two inches in diameter. The fact is that the wild berries of the world constitute a resource of great value largely awaiting exploitation. Hundreds of millions of dollars worth of new fruits could soon be given to the horticultural interests of the world from the improvement of the wild berries alone.

ASHES FOR VEGETABLES.

Wood ashes contain potash, phosphoric acid and lime, all of which are useful in the growing of vegetables. The ashes are usually valued more for the potash which they contain than either of the other two constituents, for vegetables require potash more than lime or phosphoric acid. On clay soils, lime has an additional advantage in that it liberates potash from the soil. Thus the ashes will supply potash direct and lime will liberate it from the insoluble combinations in the soil. If you can buy wood ashes that have not been leached, and of which you know something of the history, for five cents per bushel, they will make a very cheap form of fertilizer. For vegetable crops you may safely apply these at the rate of a ton to a ton and a half per acre.—Prof. R. Harcourt, O. A. C., Guelph, in Canadian "Horticulturist."

The Ornamental Garden

ARRANGEMENT OF FLOWERS.

A number of years ago, when Pittsburgh was noted more for its smoke than its millionaires, they had over in Allegheny a park which was then and still is traversed by the Pennsylvania Railroad, says a writer of the Tribune Farmer. In summer the traveler looking from the car window would see bed after bed of flowers laid out with careful precision. There was usually the name of the park done in brilliant letters, and I recall among other designs the shield of Pennsylvania and pictures of Washington and Lincoln done with skill. It was all very novel and striking, but was it art? The landscape gardener who had charge of the park thirty years ago was not an artist, but rather a mechanical genius. Now, to be an artist of any kind a man must have an eye for form and color. But the true artist will study nature and thus learn to avoid the pitfalls of designs that are very far removed from nature.

In our home gardening we are not likely to undertake anything of the sort that I have described and which may possibly be permissible in a public park or railway enclosure, but we are more liable to let our flowers run riot with very little thought for their relative color or size.

Our crimson petunias may have been planted near the maroon nasturtiums. What a clashing of colors this makes, and yet either alone in a clump is very effective. Nasturtiums are coming back into favor, but deservedly, for they are easily grown and when once in bloom are fairly luxuriant. The Nicotinana is very suitable for planting along the house by a porch; it grows about three feet high, has broad tropical-like leaves and the clusters of flowers are quite fragrant. The Nierembergia is pretty for baskets, with its white lilac tinted flowers. The Nolana has flowers in different shades of yellow, blue and white, and is especially desirable for borders of the low trailing kind.

The petunias we have always with us, and they deserve more consideration than they sometimes get. As I said at the beginning, we spoil the effect of these flowers when we place them in juxtaposition with others whose colors do not harmonize with them. They come in various colors now, so that our artist sense need not be offended if we have not space for them alone.

The salvia, or flowering sage, as it is sometimes called, is one of the most brilliant plants we have for our gardens. I have seen them massed up against a porch with very good effect. Last summer I put mine in a large circular bed in the front yard. As they were planted rather late they did not commence to bloom until the latter part of July. But I was rewarded for this delay, as they were at their height in September, and the magnificent red flowers were fit harbingers of the season soon to come. They have a most compelling fascination for the passerby, though there is nothing ostentatious in their blazing spikes.

A small bed of pansies should have a place in every garden if there is a spot of uniform sun and shade. The soil should be enriched and kept moist. One will be repaid by the continual blossoms which are produced, and nothing is more decorative for the dining table or for our living room than a shallow dish of these fascinating little blossoms.

GRASS CULTURE.

Great care should be taken by the gardener with his lawn. It is the canvas upon which he will paint his flower bed pictures and landscape effects. To be successful he must prepare his canvas well.

The nrst thing is to grade the ground, smoothing rough surfaces, making proper level stretches and gentle slopes. If possible, the lawn should slope from the house. The grading should be done so as to distribute evenly all surface water, avoiding the formation of little runs which might produce washouts.

The soil should be enriched with a liberal supply of well rotted manure. This is essential where the soil is lacking in humus; otherwise bone meal or other good fertilizer is useful, and manure often contains the seed of weeds. The ground should be plowed or spaded not less than eight inches deep, removing all the stones and similar material, and the surface made as smooth as possible. Then it is ready for sowing.

One of the best mixtures for the lawn is four parts Kentucky blue grass with one part of white clover, sown not less than five bushels to the acre. Equally good results are usually obtained by the use of redtop in place of the blue grass or with equal parts of redtop and blue grass and a little white clover. When moisture is plentiful the blue grass forms a softer turf than the redtop, but does not seem to endure drought so well. In shady places the blue grass mixture is best. Nothing but pure seed should be sown.

It is well to be liberal with the seed, not to scatter it too thinly and to reseed portions that come up poorly.

PLANT BULBS.

I am rather a crank about flowers and always have been, and as one friend of mine expressed it I am always inclined to "spend my substance in riotous horticulture." I never had much hankering for luxury in the way of dress or showy house or anything of that kind, but just as sure as I get my hands on a few extra dollars it goes for something extra fine in the way of gladioli bulbs or peonies or lily bulbs or something of that kind. I suppose every man has his pet extravagance, and that is mine, but I believe I get more pleasure out of it than most people do out of their extravangances—anyway it suits me better, and every man to his notion. The bulbs are not expensive and they are always sure to bloom.—St. Jo Fruit Grower.

Maggots in the pot dish may be destroyed by setting the tub in hot water —not boiling—and leaving it there an hour. The maggots will be nicely cooked by that time.

Tuberoses are so easy to grow, the wonder is there are not more of them.

OF COURSE.

"And I am the very first you have loved, Bertha?"

"Of course you are. How tedious you men are! You all ask the same question."—London Opinion.

Malthoid Roofing

L. B. Valk, a leading architect of Los Angeles, Cal., U. S. A., writes:

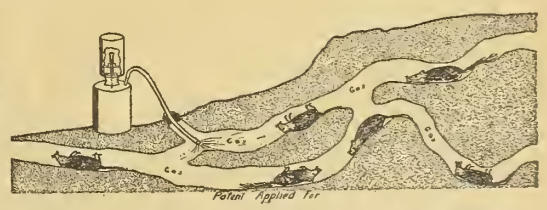
KILL

Pocket Gophers, Moles and Squirrels

More than 500 feet of holes flooded with gas in five minutes, at a cost of three cents, no pumping required, kills them by the dozen in a single operation. Not an experiment, but a sure destroyer of the pests; just turn on the gas and the work is done. Guaranteed not to injure vegetation. No danger. Any one can operate it.



Fully guaranteed. Your money back if it fails to do the work. Sent prepaid on receipt of price, with supply of carbide for ten acres, ready for instant use $5.00; without carbide $3.50.

Patent applied for. Agents wanted.

Write today for catalogue and description.

W. H. Lamb, Director in Bank of Santa Cruz County and Hardware Merchant in Santa Cruz, Cal., says:

I am sole agent in Santa Cruz County for the Rodent Destroyer. Am selling them rapidly and have never heard of one that did not give satisfaction. THEY DO THE WORK. The owners of the patent are reliable people.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Organize.

I would like to ask through the Cultivator a question that seems strange to me. In the daily and weekly papers the prices quoted for new potatoes have recently been $1.50 per 100 pounds.

When a rancher takes his goods to sell, and No. 1 goods too, the commission houses offer about $1.00 or less, and have to take out commission, too.

What I want to know is where do these reported prices originate, and what rancher ever gets them. As far as I can see a rancher is lucky to get back his money for seed, etc., never mentioning his labor and expenses, and if that is the case with most ranchers, then they will have to be a millionaire to start with; and how can a man of moderate means stand it. Surely there must be some way that a rancher can get what his goods are worth.—Early Rose.

The quotations, as given in the Cultivator, are supposed to be a fair average. Of course, when a producer brings his goods to market, it becomes a case of barter, and the commission man or buyer proposes to get all the traffic will bear, if he can. While at the market recently the writer asked as to quotations on plums. They were given at 85 cents and $1.00 and within a few minutes, while yet in the market, a fruit grower appeared with unsold plums which he offered to the same man who had given the quotations above noted, and who refused to buy at any price. The owner finally asked if he would give half the quotation price and take the plums off his hands, and the buyer refused. Yet, we doubt not that on the same day plums were sold at the price quoted. One point is that the markets are full of tricksters who play back and forth so as to deprive the producer of his honest returns.

In addition, we must note that this year has been almost disastrous to producers, and fruits and vegetables have all sold at ruinous prices.

As to place of prices originating, it is to a certain extent in the open market, but more generally in the Produce Exchange. Staples, such as butter, eggs, potatoes and others are knocked back and forth when possible by speculators who wish to bear or bull the market as may benefit them.

The last sentence of your letter in which you say, 'Surely there must be some way that a rancher can get what his goods are worth." Indicates the spirit which, if general among producers, will result in action which will bring to the producer all the market will justify. For we believe that this spirit will lead to some co-operative movement which will aid producers in securing their just deserts The poultrymen of Northern California, especially of Sonoma county, after years of exasperating treatment, have finally got together and succeeded admirably this year in disposing of their products. Other poultrymen of San Benito county are organizing for an aggressive movement both in purchasing supplies and in selling their products. Whether vegetable, potato and onion growers can succeed in such a movement with the great number of Japanese and Chinese engaged in the industry is hard to say, but we believe it is worth consideration.

We believe the time is ripe for the producers to organize. A committee if made up of business men—men with business capacity—will accomplish great good. Such a committee with a large quantity of products of one, or a few kinds, will receive courteous treatment. The citrus forces have proved this and are now in a situation where a request is received courteously. A farmer with a load or a few loads of produce has no standing.

Let the producers get together and demand attention.

Skunks Robbing Bees.

A subscriber who noticed the recent inquiry regarding killing bees by the skunks, gives us the following hint which may be of value. This subscriber says that the way he protects his bees from the robber has been developed by noting the manner of the skunk's work. He says he has noticed that the skunk kills the bees by first putting his head or his nose at least into the ground in front of the hive. This prevents the bees' attack at his vulnerable point. He then waves his tail until it is covered with bees when he picks them off and eats them. His remedy is to place a slice of liver which has been poisoned with strychnine an inch or so deep in the soft dirt in front of the hives. When Mr. Skunk attempts to bury his nose in the ground in his usual manner he finds the tempting morsel which is promptly swallowed and the skunk finds his finish.

Camphor Distillation.

I have several twelve year-old camphor trees which I am about to remove from my orchard. Will you kindly tell me in your valuable paper if I could profitably make them into camphor?—M. F., Pomona.

Camphor is secured by distillation of leaves, twigs and chips of trunk. The exact process we cannot give you, but would advise you to write the Department of Agriculture at Washington, D. C. We do not think its making is simple enough to permit you to do it economically for a small quantity. The Department has experimented with Florida grown camphor and reports: "It has been established by experimental distillations made from a number of Florida grown trees that twigs and leaves obtained by pruning the trees of various ages yield from 1½ to 2 per cent of crude camphor." Your trees may be of value to the department in its experiments.

Land Open to Entry.

Several queries have come to the Cultivator regarding land in Southern California thrown open to entry within the bounds of the Forest Reserve. All we can say regarding this land is that, as was noted formerly, the only place to secure information is through Gifford Pinchot, Forester, Department of Agriculture, Washington, D. C.

Southern California apricot crop is practically all in.

Veterinary

Dr. R. T. Whittiesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Lameness.

My horse got hurt about ten days ago by falling on the board floor of his stall. He strained his hip and limps very badly. Do you think he will limp permanently or will he soon recover? I have been bathing his hip with hot vinegar and salt.—G. E. C., Los Angeles.

Your statement of the condition of the horse is not sufficient to allow any intelligent answer. I must accept your diagnosis that it is a "strain in the hip," but you don't say if it is a strain of muscles or ligaments or tendons, or what joint, if it is a joint. Are you positive it is a strain at all? Do you know that it is not a bruise from falling on the floor? And are you sure he is not lame in the hock or ankle from struggling to get up?

If I were to prescribe for your horse and he did not get well you would criticize me for not knowing more, when there is a possibility that you may be wrong in your diagnosis.

Within the last few weeks I operated on a fast racing mare for lameness in the foot and cured it completely, the owners being positive the lameness was in the shoulder, and having tortured her with a blister until she will carry the scars as long as she lives.

And I want to request of the subscribers to the Cultivator, that in making inquiries in this department they give me all the symptoms and a full history of the case; how the animal came to get hurt; how the leg is held in rest; how the animal walks or trots on it; whether it gets better or worse if exercised or if allowed to stand still. Give me all the symp- and let me form my own opinion as to the diseased condition.

GOPHER POISON.

I feel it my duty to tell my fellow fruit growers of an unfailing solution of the gopher problem.

It is a fact, however, that if it were impossible to eradicate the gopher it would be equally impossible to raise oranges. Valuable land, costly water and high-priced trees would count for nothing if this master girdler were not held in check. The devices which have been put forth to annihilate him are legion, and every one of them has been heralded as a sure thing. They range all the way from fire to water, from a smoker which looks like an ice-cream freezer to a device which resembles a hose nozzle but is really a concussion gun. Traps there are which might be taken for a pair of shears, and others which seem to be an aggregation of knitting needles. Of wire traps there is no end. I myself patented one some years ago. I sold the patent, but have never bought or used any of the traps, because I found something better. It is simply alfalfa and strychnine—two or three stalks of green alfalfa, the ends doubled over and tied with a string so that the tuft on the end somewhat resembles a fist, and a little strychnine mixed with orange juice concealed inside it. Like all the other schemes, this is a sure one. It is important to find the main runway and push a bait into each opening, closing the hole behind it with earth. Twenty-four hours later the holes may be reopened, and if they remain open the gopher is dead. I have been following this method now for half a dozen years—with my right hand up—it has never failed. If you doubt it try it.—Highland Messenger.

PLANT LOUSE REMEDIES.

This is the time of year when plant lice, often known as "green flies," or "green bugs," increase rapidly and become serious pests to out of door plants and trees. A few that are almost certain to attract attention are the red louse of golden glow, the black louse of the cherry trees, the black peach aphis, green lice upon rose bushes, cabbages, apple trees and plum trees, the woolly aphis of the apple tree, and probably many others. These plant lice are usually rather easy insects to kill if taken in time.

The food of the plant lice is always the sap of the plant they infest. As this sap is taken through a hollow beak that is thrust beneath the surface, it is useless to attempt to poison them through their food supply.

The remedy must be a contact insecticide, one that will kill by coming in contact with the body of the louse. The most effective insecticides of this kind for summer use are oil emulsions, tobacco decoctions or soapy mixtures.

To Prepare the Kerosene Emulsion.

Dissolve one pound of ordinary washing soap in one gallon of water. While the latter is still boiling hot remove from the stove and add two gallons of kerosene. Agitate this by pumping it forcibly back into the vessel containing it and then dilute to thirty gallons, when the mixture will be ready for application. It is best to apply at once.

Black Leaf Dip.

One of the best remedies for plant lice is the common sheep dip sold under the name of "Black Leaf." Dilute this with water in the proportion of one part of the dip to seventy parts of water, and you will have one of the very best spray materials for the destruction of plant lice.

Whale Oil Soap.

Any good whale or fish oil soap in the proportion of one pound of the soap to eight gallons of water will be found quite sufficient for the destruction of plant lice if sprayed with force and thoroughness upon their bodies.—C. P. Gillette, Entomologist, Colorado Agricultural College.

"How do I measure my hay in the stack? Why, this way: Measure the stack in length, width and over. Multiply the width in feet by the over and divide by four. Then multiply the result by length. To reduce to tons of hay in stack for less than 20 days, divide the cubical contents by 512. For more than 20 and less than 60 days, divide by 422 and for more than 60 days, divide by 380."

Ten years ago there were only six beet sugar factories in the United States. There are now seventy, the smallest representing an investment of $500,000 and the largest over $3,000,000. The factory located at Spreckles, Cal., is the largest sugar factory in the world, having a capacity of a beet train a mile long every day in the year. The chief beet sugar States are Colorado, Michigan, California, Utah and Idaho.

California Farm Names

THE appreciation of the work of the Cultivator in urging the naming of the farms is being shown more and more each day by the letters which bring expressions of good will. Almost invariably the expression is made that a name for the home not only has a sentimental value and a value from the pleasure it gives to the inmates of the home, but, if followed, will add to the financial worth of any community. As one writer expressed it in last week's Cultivator, "It places a premium on keeping the place in better condition, and the better condition of the place inspires more careful work with the crops of the ranch."

We have this week a number of new names from all sections of the State.

"Home Orchards," owner Frank Femmons, Ahwahnee, Madera county. Mr. Femmons has neatly printed letter heads in which it is shown that the product of "Home Orchards" is principally made up of mountain grown apples and peaches. "Experimental testing of new apples and other fruits a speciality." Mr. Femmons writes: "I send you greeting from 'Home Orchards' a little home-made home in the mountains of Madera county. It's a little nest of a place—a cove on the mountain side where the sunshine smiles and the birds chirp and chatter among the trees and flowers. The great Sierra Pine Forest stretches across the brow of the mountain above us and the valley of the Fresno river, with its oaks and scattering pines, witht here and there a mountain home, is a thousand feet below. Across the nearby hills and the great San Joaquin valley the Coast range of mountains is outlined against the sunset sky where they, with feet on the shore,

Are guarding the coast of our Gem of the West,
The fairest, the grandest, California the blest."

"Argyle Orchard and Farm," owner Robert Adams, Beaumont, San Bernardino county. The letter head says that the principal fruits grown on the ranch are prunes and Muir peaches, Tokay, Mission and Muscat grapes..

"El Modello Fruit Ranch," owner Charles F. Collins, Dinuba, Tulare county. The letter head says that Thompson seedless, Sultana and Muscat grapes, also Elberta, Lovell and Muir peaches are the principal fruits raised. Mr. Collins writes: "I take pleasure in complying with your request to forward the name of my ranch. It would certainly add much to the appearance of the country and often to its convenience if every farmer had his own as well as his ranch name near the entrance or on his mail box if on R. F. D. It not only looks enterprising, but it is enterprising."

"Rancho de la Rosa," owners Mr. and Mrs. C. A. Rose, Le Grande, Merced county. Mrs. Rose writes that this ranch consists of 480 acres, and is a part of the old Fremont place.

"Lemora," owner L. G. Joslin, Chula Vista, San Diego county. Mr. Joslin writes: "We have lemons, oranges, deciduous fruits and vegetables, and the finest climate in California. No fogs to speak of, no hot weather; 82 degrees is the highest so far this year. We always have cool nights and a nice breeze from the ocean." Mr. Joslin has the right spirit in having the best on earth. Nearly every farmer in this State can make a like good claim .

"The Love Ranch," owner D. C. Love, Filmore, Ventura County. Mr. Love writes: "I have advocated naming the ranch for a long time and have found that it pays. Love Ranch is situated two and one-half miles southwest of Filmore in the Bardsdale tract. We have a sign on the barn, white back ground and black letters, with "The Love Ranch, D. C. Love, Propr." The letterhead shows the products of the place to be oranges, lemons and apricots.

"Wildoe-Astoria Villa," owners, J. K. Wilson and G. Thornton Doelle, Nestor, San Diego county, Cal. Devoted to general ranching and farming interests.

Warranted to give satisfaction.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

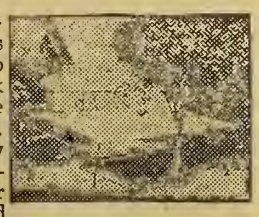
Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

Smith's Fruit Gatherer



A fruit gatherer that enables two men to do the work of six and not bruise or soil the fruit. Cut shows only one half of machine. Good for fruits, nuts and olives. Can be furnished on short notice. Circular and prices by return mail.

WM. SMITH, 1324 Catalina St., Los Angeles, Cal.

MAINTAINING SOIL FERTILITY.

If a soil is already fertile, in order to maintain its fertility, the favorable conditions must be retained.

First, the organic matter present should not be allowed to fall too low, but the losses which take place during cultivation should be restored by means of barn yard manure, or by ploughing under green crops.

Second, a sufficient supply of active lime must be maintained. Lime is lost in the crop which is carried away, and in the water which passes through the soil. If a sufficient quantity of active lime is not maintained, the soil will produce a smaller quantity of active plant food each year and will decrease in fertility, and it may also become acid. Some crops require more active lime than others.

Third, a sufficient quantity of active phosphoric acid, potash and nitrogen must be maintained in the soil. There are soils in which this can be done for a time by thorough cultivation, the use of green crops, and the prevention of losses of active plant food as far as possible; but eventually the fertility of the soil cannot be maintained without the use of manures or fertilizers.

Active plant food is lost from the soil in two ways: First, it is taken up by the crop, and removed with it; and, second, it is lost by leaching. A portion of the plant food remains in the straw, leaves and other by-products of the crop; and if these are saved and returned to the soil, the loss through the removal of the crop is correspondingly decreased.

If the by-products are burned and the ashes returned to the soil, only the nitrogen is lost, but nitrogen is the most expensive kind of plant food.

Plant food is also lost from the soil in the water which passes through it. Phosphoric acid is lost in this way to a small extent, potash somewhat more, but the greatest loss is nitrogen, which is washed from the soil in the form of nitrates and ammonia. Often more nitrogen is lost by washing from the soil than is taken up by the crop.

It is obvious that plant food cannot be continuously lost from the soil without a decrease in fertility sooner or later. All, or a portion of the loss, must be restored in order to maintain the soil in a fertile condition.

Plant food can be restored to the soil in several ways:

(1) By Manure.

Manure contains a portion of the plant food which is fed to the animals. There is always some loss in its collection and preservation, and unless a quantity of feeding stuffs are purchased, manure alone cannot maintain the fertility of the soil. Manure is, however, of benefit to the soil by virtue of the organic matter which it contains, and it should be preserved and utilized as thoroughly as possible.

(2) By Leguminous Crops.

Leguminous crops have the power of taking up nitrogen from the air, and fixing it so that it is of value to other plants. If, then, leguminous crops such as vetches, peas, alfalfa, clover, peanuts, beans, etc., are grown they secure a portion of their nitrogen from the air, and add to the fertility of the soil, if ploughed under. The roots and stubble also add to the fertility of the soil; but, perhaps, the most effective way of using leguminous crops, is to feed them, save the manure carefully and use it on the soil.

Every farmer should grow leguminous crops as extensively as possible. for his own use in feeding, or for sale, or for plowing under. The importance of these crops will become greater and greater as the nitrogen in the soil decreases. Nitrogen is the most expensive kind of fertilizer, and, so far as possible, it should be secured from the air and not by purchase in feeding stuffs or fertilizers.

Leguminous crops do not add to the store of phosphoric acid or potash in the soil, and may indeed require these fertilizers to effect their best growth. However, the organic residues which they leave may aid in rendering inactive potash or phosphoric acid active.

(3) By Fertilizers.

Fertilizers may contain phosphoric acid, nitrogen and potash, in active forms, and are used to supplement the active plant food of the soil.

Irrigators at Sanger, Fresno county, are having some contention over ownership of water, which is rather shorter supply than usual.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

MACHINERY.

FOR SALE—ONE NO. 8 CENTRIFUGAL pump (vertical,) good as new, with all fittings, very cheap. We have an all steel frame traction running gear without power, very cheap. One 20-H. P. firebox boiler and 15-H. P. engine, all mounted and in fine shape, ready to go to work. Come and see it. One 6-H. P. gas engine, all in fine shape, good as new, for $75. A. CANNADY & CO., 1029 N. Alameda St., Los Angeles, Cal.

COMPLETE PUMPING PLANTS, GASOline engines and centrifugal pumps bought and sold and exchanged; new and second-hand. See us before buying. Can save you money. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles.

BRAND NEW—DISTILLATE ENGINES 10-H. P., $250; 20-H. P., $400; 30-H. P., $560; 40-H. P., $700; 60-H. P., $900. Best in the world for pumping plants. See ad page 96. COWHAM SMITH CO.

FOR SALE—AT HALF ACTUAL VALUE No. 7 U. S. Cream Separator, good as new. One No. 9 machine new, to close out. K. B. Norswing, 5833 S. Main St., Los Angeles.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FOR SALE—3-H. P. AND 6-H. P. VERTIcal Peerless Engines never been used. Will sell cheap. 117 BRUNO ST., Los Angeles.

FARM LANDS FOR SALE.

THE OLD FARM.

When the busy day is over with its anxious hopes and fears,
And the telephone stops ringing and the last clerk disappears,
With a sigh I lean back weary in my swinging office chair.
And my thoughts go back to childhood and the old farm that is there.

I can see the dear old homestead, broad and low, beneath the trees,
And the row of shining milkpans sunning in the fresh, sweet breeze;
I can see the barn and horses, and the orchard on the hill,
Where we gathered golden pippins for the old straw cider mill.

I can see the upland pastures dotted o'er with grazing sheep,
And the wheat fields waving golden, ready for the men to reap.
I can see the old stone fences where the chipmunks used to play
And the cornfield, and the meadow with its piles of fragrant hay.

I can see the cattle standing 'neath the willows of the brook
Where I used to fish minnows with a bent pin for a hook;
And the pond where grew the lillies that my mother used to prize.
Ah, the light of heaven's shining now within those dear old eyes.

And I sigh while fancy lingers o'er each well-known pleasant scene
Of the happy days of boyhood thrown by memory on the screen;
And I'd give all I have gained since, all my wealth and treasnres rare,
To go back again to childhood and the old farm that is there.

—Maxwell's Talisman.

LAW OF THE RANGE.

ON THE western slope of the great Cascades where the Columbia rolls blue to the sea and the sun smiles warmly on the hundred-mile ribbon of green, luxuriant pasture range, there the word of the law was Force and the strength of the Stronger Man.

Old Jim Markleton, in all the years his cattle had ranged that slope, had been the Stronger Man and the Law, and when Bud Bledsoe and his sheep outfit came up from the south there had been a dividing line marked down by the Law which Bledsoe's sheep were to severely respect. The dividing line was Hopkins' Creek and the price of passing—death. Bledsoe's sheep chopped the stubby grass above Hopkins' Creek until there was none left to crop, so they crossed. It was then that the war began.

Martha Markleton, breathing deep the mountain air, rubbed her eyes and looked to the dawn-kissed peaks of the snowy Cascades. Rising white and blue and straight as a temple column, a thin shaft of smoke sought to touch the heavens. The girl choked in her deep breathing and turning ran fleet-flooted to the house, her eyes wild with excitement.

"Dad! dad, dad!" she cried, "they're comin';"

There were four of them when they rode away, Old Jim, Mat Hicks, Tom McConnel and Martha. The old man swore at her coming.

"It ain't goin' to be no picnic, girl," he chided; "there'll be some killin' and a reg'lar barbecue of sheep. I'll kill Bud Bledsoe if I can. Likewise he'll kill me if he can."

Martha Markleton fell to thinking. Once in her lonely rides she had met Bledsoe and talked with him. Taught to despise sheepmen, she had found it hard to dislike Bledsoe, who had a "way" so different from her own folks and kind which she had read about in books. He was a good-looking young chap, good-looking in spite of his red hair, and, what was greater, he seemed to have no more fear of her dad than she. "When the grass is gone up yonder," he had said, "then we will cross the creek." After that he had recited his opinion of a man who thought he owned the whole State of Oregon, which made her very angry, and immediately following that he had made her gasp when he said: "I believe that I already love you and will want to marry you some fine day." Even now her heart beat faster when she called it to mind.

And now her dad was riding out to kill Bud Bledsoe and Bledsoe to kill her dad.

It was near to noon when they came across the Bledsoe's party. "Peg" Donaldson, Markleton's lookout, who had signaled the march of the enemy, had taken to the woods, and showed up after the fight was over, pale and embarrassed. Plugged deep by a bullet from one of Bledsoe's men, old Markelton lay cursing and spitting blood, while his stalwart enemy, Bledsoe himself, bandaged him up, carried him into his own shack, and laid him carefully on his own bed. Then he left him in care of Martha, while he rode down into Somerset, 14 miles away, to fetch a doctor.

Markleton was old, and it took him a long time to get well. It was a very long time, even before he could be moved to his own ranch. Disgruntled of the big, red-headed sheepherder and his men, old Jim begged his daughter to stay with him.

Martha Markleton stayed at her father's side and cried when Bud made love to her, and scolded her father for terming their host a "good-for-nathin', murderous sheep-hooker."

But in time old Markleton began to hold this indomitable young "cuss" in awe. Hours at a time Bud and he cheerfully wrangled at politics or poker, the younger man always coming out modestly victorious in the end.

One day (the old man was able to hobble about) Bud broached the question.

"I love your daughter, Jim," he said, "and she loves me. She's never quite said so, but she does just the same. Never mind now! Wait until I'm through talking. I've got a proposition. The law of the range is what I say. You're a back number, a good-for-nothing old cowpuncher. Pray don't get excited. Suppose we make it 'Markleton & Bledsoe.' You know the law of the range is what I say."

"Dad, dad," said a small voice, "do!"

The old man thought it over just one minute and again the small wee voice said: "Dad, do!"

"The law of the range is what she says," old Markleton flared up, and he again began cussing his luck.—Universal Magazine.

The Personal Neatness Club

"KEEP your face clean" should be superfluous. Body cleanliness should be as needless to speak of, but unfortunately some are not as careful as may be best for the complexion, which is an indication of the condition of the body. Perhaps one who may be careless in this matter may not be charged with being unclean, but has not used the cold water dash with that regularity which brings the glow of the most perfect health.

Use the water freely. As to using it on the face, M. H. comes with some suggestions this week as follows:

CARING FOR THE COMPLEXION.

It is said that a lack of cleanliness is the cause of one-half of the unhealthy and disfiguring skins one sees every day, and it takes frequent bathing to keep the pores of the skin open and active so they can expel the waste matter, and keep the complexion pure and clean. It is an excellent practice to wash the face at night just before going to bed; then the face is cleaned of floating dust and particles that might cause blackheads and pimples, and that is the only time that soap should ever be used on the face. The manner of washing and wiping the face has much to do with the general condition. When washing and drying the face, rub upward and outward, never down, and with care. Flabby cheeks can be made firm and round by the constant use of a good skin food and rubbing upward. Hard water is ruinous to any skin and even when rain water is used a little borax should be added, as the borax makes the water softer and helps to keep the skin firm and smooth, and the borax water is a splendid tonic for the eyes as well as for the skin. Face foods and the ingredients for the same are not always in the reach of country people, but one of the very best foods for the face is poultry fat of any sort, and especially goose grease. This may be clarified and perfumed to suit one's taste. Hot milk is a safe, nourishing lotion for the skin to restore its plumpness. Lay linen wet in it on the cheeks after massaging the face.

It is said that the following treatment is an excellent remedy for blackheads: Wash the fact at night with hot water and good toilet soap, then follow this with a wash of cold water to rinse every particle of the soap away, then with a piece of old soft linen. In the morning bathe the face with hot sweet milk, and rinse with cold water, and you will soon get rid of these facial blemishes.

M. H.

WHERE MOTHER IS.

Old-fashioned flowers, with fragrance sweet,
Bloom, where mother is.
Life's a psalm, a song replete
With joy, where mother is.
There all woes and sorrows cease,
Naught but rest and heavenly peace
Dwells, where mother is.

The jostling crowd, the wearing din,
Are not, where mother is.
The flaunting rags of shame and sin
Reach not, where mother is.
Heart-sick, brain-tired, nerve-wracked soul,
Before thy tear-dimmed eyes a goal
Exists, where mother is.

All grief and doubt and unbelief
Flee, where mother is.
Hope and faith and sweet relief
Come, where mother is.
Mother, mother, name most sweet,
Heaven guide my weary feet
Home, where mother is.

A clean, dry sponge is the best thing to use in removing lint from woolen material.

Arranging for a Luncheon

PROBABLY most of us are unable to have both cook and waitress, and when we offer our friends luncheon must cook and serve it as well as preside at the table, and this necessarily prohibits us from attempting many little niceties of cooking and serving. We all want to know the correct way to do things, however, and are willing to work hard to even approximate the standard of dainty living. The following article by Mrs. Sherman certainly offers many valuable and tempting suggestions which we can adapt and simplify for our individual needs. The idea of having printed lists of the things to be done, arranged in the order in which they should be taken up, would be a great aid to the woman who grows confused under the strain of being cook, waitress and hostess at one and the same time.

* * *

Menu for Luncheon.

The trouble that a few guests make in the ordinary home is unnecessary. A simple lunch that is easily prepared as it contains only three hot dishes and coffee, can be handled with the ordinary maid. The following was served on July 10th and proved acceptable to both ladies and gentlemen. The enclosed slips were typewritten and pinned up for the maid; the hostess then simply takes her place at the head of the table and never exchanges a word with the waitress during the service. The cook and waitress have the printed instruction to go by and are not worried by trying to remember the details of service. The plates, doilies and silver are all ready for them. The dishes used are put in the kitchen and pantry and under the edge of each pile is slipped a bit of paper with the name and number of the course it belongs to. The cover plates may be the same through the meal. Have extra doilies to take the place of any that may be soiled. Paper is often used for doilies, but it has rather a hotel look, and if the family entertain at all it will pay to have these of linen with a neat embroidered edge. Some of mine have been in constant use for ten years, and a few are closer to twenty years old; they last a long time and give the table a pleasing freshness.—M. E. Sherman.

* * *

Slip for the Waitress.

Set table with ice in the glasses. One glass full of ice water and one of orangeade at each place. Put on bread and butter plates with butter, one piece of bread and two crackers. Set table with one butter spreader, one boullion spoon, fish fork, dinner fork and knife, salad fork, 2 teaspoons, cake fork, coffee spoon.

* * *

Put on cover plate with doiley. Set the clam juice in bouillon cups on this plate. Reduce the clam boullion to taste with cold water, have it well chilled and drop a heaping spoonful of whipped cream in the center of each cup. Remove the bouillon cups. Leave the cover plates and doiley.

* * *

Salmon, Cnaud Froid with cucumbers. Remove cover plate with this course.

* * *

Young turkey fried. Serve on the dinner plates; put the mashed white potatoes on the same plate. Serve string beans on small plates after having served every one with turkey. Fill all glasses that are empty now before the next course.

* * *

Put on cover plates with doilies under the salad. Serve the tomatoes on small plates. Stand the oil and vinegar on the table. Remove the tomato plates leaving the cover plates.

* * *

Apricot ice and cake. Serve the cake on small plates. Stand the apricot ice on the cover plates in tall glasses.

* * *

Remove the ice cream service and doiley. Leave the cover plate. Put on the cheese and crackers. Serve the coffee and stand the finger bowls at each place.

* * *

Do not hurry or worry. If any mistakes occur quietly omit that portion of menu as there is plenty without any one course. Let them take it slowly and enjoy the good viands and excellent service to the fullest Remember they may not have a chance again to get anything so good.

* * *

For the Cook.

Clam bouillon. Reduce the juice one-half with water and season it. Fill cups a little over half full. Have it cold but not iced. When serving add a teaspoonful of whipped cream.

* * *

Salmon. Take a scant cup of whipped cream for this. Two cans of salmon, picked and shredded on a clean napkin to make it dry. Mix it with the juice of a lemon and a little Worcestershire sauce. Have enough gelatine dissolved to make a stiff quart of jelly. Mix this with the salmon. Just when it begins to stiffen a little fold in the whipped cream. Put the mixture into cups and let it harden on the ice. Have cucumbers well sliced and in vinegar with salt and pepper for a couple of hours. Turn out the salmon on individual plates and surround with a ring of the cucumbers. Have these well drained and do not use any oil on them.

* * *

Young fried turkey. Serve on dinner plates with the mashed potatoes.

* * *

Serve string beans with cream dressing on small plates.

* * *

Tomatoes filled with tomatoes and cucumbers. Use French dressing or Mayonaise; either will answer.

* * *

Apricot ice and cake. Serve the ice in regular glasses and cake on small plates.

* * *

Serve the coffee with crackers and cheese.

Save the slices of bread which are not eaten at meals and cut them in small cubes and brown them in the oven to use in soup, or brown and grate them to use in thickening gravy.

When the handles of steel knives used in the kitchen become loose or come off, they can easily be mended with resin. Pour a little powdered resin into the handle, then heat the shank until it is red hot, and thrust it quickly into the resin, and when it is cool the handle will be firmly fixed.

Tray cloths and napkins made from flour sacks are convenient and easy to make. The cloth is loosely woven and the hemstitching is quickly done at odd moments, and you can cut them any size you want, and these small cloths are a great saving to the table cloth.

The Oldest Savings Bank in California

The Produce Markets

Los Angeles Markets

LOS ANGELES, July 22, 1908.

Butter.

Butter remains at last week's quotations with but little of interest in market conditions other than market is weak.

Wholesale quotations now are:

Creamery ex per roll................50
Firsts........ ....47½
Dairy........ 25
Cooking.... 25
"Butterine"...... .. ..15@20

Cheese.

Cheese has declined and at present is very weak. It is said that cold storage has enough cheese to supply needs of this market for six months.

Southern California..... ......14½@17
Northern fresh........ ....12½
Longhorn........ 17
Eastern singles...... 16
Cheddars........ 17
Imported Swiss...... ....28@30
Swiss........ ....16½@17
Oregon........ 15
Limburger........ ....17½

Eggs and Poultry.

Eggs are remarkably strong and have advanced 3 cents during the week. The demand for fancy stock is exceptionally strong. Even at the advanced price cold storage eggs are coming out slowly. More Eastern eggs are expected soon.

Eggs local candled........ 28
Eggs case count...... ....25½@26
Firsts fresh...... 27
Eastern fresh........ ....22@23

Wholesale prices..

Hens per lb.......... ....10@12
Young roosters per lb................17
Fryers.... ....15@17
Broilers per lb...... ....15@17
Roasters......... 16
Old Roosters............ 7
Turkeys...... ....16@18
Geese... ....11@13
Ducks......... 10
Squabs...... ....1.25@1.50

Live Stock.

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs from 175 to 200 pounds..6¼ @6½
Prime steers........ .. ..4¼
Heifers...... ....3½@3¾
Calves per lb........... ....4½
Sheep ewes per head...... ..3.75@4.00
Lambs per head...... ....3.00@3.25
Wethers........ ....4.00@4.50

Potatoes.

Potatoes are unchanged and featureless, other than that the market is still very weak and supplies large.

Wholesale prices are:

Sweet potatoes per bx new crop 2.00
White Rose new ....1.25@1.40

Onions.

Onions are as flat as ever with large supplies in sight. Quotations same as last week.

Wholesale quotations are:

Bermudas per 100....... ....1.00
Bermuda per crate........ 50
Silverskins new...... ....1.15@1.25
Crystal wax per crate.......1.00@1.25
Northern Red..... ....1.05@1.25
Garlic........ 7

Vegetables.

The following are commission house prices; deduct freight and commission to secure farm prices.

Hemet reports an apricot crop that exceeds all expectation. Two large dryers have been at work for the past three weeks, and almost a dozen individual ones as well. About forty cars of the green fruit have been shipped from here. Lowry and Pitker, ranchers east of town took 50 tons from 368 trees, and sold them for canning. The dried fruit here is of a very fine quality.

Hay.

Somers & Co. say:

Shipments of hay to the San Francisco market show but little variation from the average of last week, the total showing 2910 ton in comparison with 2760. The situation continues unchanged in every way for country prices will not permit hay to be sold here to advantage and the local demand continues rather quiet. Purchasing for winter delivery has been fairly active throughout the principal growing districts during the past week but in the light of the present situation circumstances hardly warrant the prices being paid. It would appear, therefore, that the element of speculation was the principal factor in effecting present trades.

Because of existing high prices here considerable trade is being taken from the San Francisco market, reports reaching us continually of many outside points that have received their supply from this market now buying in other Coast sections.

As to the future, we must concede that the market will be a very sensitive one. There is no great oversupply in the State this year and should business materially improve, we will see some advance over the present range which in fact will be necessary in order to prevent present country buyers from making serious losses.

Citrus Market

LOS ANGELES, July 22, 1908.

About 40 to 50 cars of citrus fruits are going forward daily now, about a third of which are lemons. The orange market is satisfactory with promise of closing the season with fair return for Valencias.

Lemons are not strong. Importations are very heavy and unsteadiness prevails.

Shipments.

Total shipments to date aggregate 26,784 cars, of which 3785 were lemons. To same date last year 25,604, of which 2902 were lemons.

NEW YORK, July 20.—Seven cars of Valencias, one of mixed, one of St. Michaels, one of sweets and one of lemons were sold. The market is unchanged. The weather is clear and hot.

THE ACTION OF LIME.

Lime enters into the composition of all plants and is as much of a plant food as potash, nitrogen and phosphoric acid, only it is most always so abundant in soils that it is not considered a fertilizer. Plants will not mature properly without lime. However, the chief office of lime in the soil is to aid in the general assimilation of other plant foods. There are a few well recognized places taken by lime in soil action which, briefly stated, are as follows:

If there is an excess of soluble phosphoric acid in the soil, its tendency is to unite with iron and aluminum and become available. The presence of lime prevents this. It will unite with the lime and become as finely ground bone in which form the phosphoric acid is slowly available. It is also believed now that when lime comes in contact with phosphates that are in combination with iron and aluminum, the phosphates will change in form and become available as plant food.

Lime as a sulphate has the power to break up certain compounds containing potash that is in an available form. It also aids in forming double silicates of potassium and aluminum, in which form the potash is available, but is prevented from leaching out of the soil. It causes a rapid decomposition of organic matter in the soil and aids in nitrification, in which form it is necessary for nitrogen to exist before plants can use it.

It is thus seen that lime helps to render available all three of the important elements of plant food which might otherwise remain in an inert form in the soil. It also helps the nitrifying germs that grow on the roots of legumes to quickly become available by aiding them to form nitrates.

Sour soils are sweetened by lime. These conditions do not prevail to any great exent in California, but they do quite frequently in the Eastern States, and soils so sour that they will not produce paying crops, are made productive by the application of lime.—J. W. Mills.

THE ALFALFA SEED BED.

While written from an Eastern standpoint, the following from the Iowa Homestead has points of value for the California alfalfa grower.

Those who are planning to sow alfalfa this fall without first taking a crop from the land intended for alfalfa should understand that it is very important to get the plowing done now as soon as possible. Of course, if the land was plowed last fall it will not be necessary to plow it again, in which case plenty of surface stirring is the thing needed.

Weeds constitute alfalfa's greatest enemy, consequently it is advisable to work the land beforehand in such a way as to induce the germination of all the weeds on the surface or within three or four inches of the surface. In order to do this frequent cultivation must be practiced. We have known instances where men have kept the surface cultivated through the spring and summer months, but have in turn plowed the land a short time before planting alfalfa in August. No greater mistake than this can be made, for the simple reason that a new supply of weeds are brought to the surface only to germinate either in the fall or the following spring and interfere with the growth of the alfalfa.

In a measure the proper way to prepare land for alfalfa is the same as that involved in preparing a soil for onions. No man who understands onion growing would attempt to handle a large area of onions unless he was given a season in advance to prepare the soil, and he would do this by absolutely preventing any weeds from going to seed. He will get his soil plowed early and keep it cultivated, but would not think of plowing it again before sowing his onions.

It is true that there is considerable labor involved in properly preparing a soil for alfalfa, but it is so important that a good stand results right from the start that the expenditure of this labor is justifiable. Of course we do not say that this is the only way to prepare the land for alfalfa, because there are those who succeed quite well by plowing the land after a cereal crop is removed and fitting it by putting lots of work on the surface during the period of a month or six weeks before sowing the alfalfa in the fall. We say that in this way sometimes a good stand is obtained, but ordinarily the practice of adopting a summer fallow system is to be preferred, especially by those who are experimenting with the crop. A failure in the stand will sometimes discourage a man so that he will not again undertake to get a stand for years, and where conditions are right for the crop no man can afford to delay a single year in getting a few acres of alfalfa seeded.

BUILDINGS RECENTLY COVERED.

The Pioneer Roll Paper Co., of Los Angeles, manufacturers of Pioneer Rubber Sanded Roofing, report the following buildings as having been recently covered by their product: The new Wright and Callender Bldg.; Kerckhoff Building, 6th and Main Sts.; L. W. Blinn Lumber Co., 3rd and San Pedro Streets. Above buildings are all in Los Angeles. Grant Hotel, San Diego, Cal.; Salt Aair Pavillion, Salt Lake, Utah.

The Blinn Lumber Company's buildings required 70,000 square feet of Roofing; while that of the Grant Hotel called for 37,000 square feet. This speaks well for the building activity in Southern California.

PANICS AFFECT THE FARMERS LEAST.

The business depression which struck the country last fall has had a strong tendency to lead people from the cities to rural districts, where they have purchased small holdings. Hundreds of new settlers have purchased land and moved out where they can enjoy the freedom of the country and live more economically and be independent. Life in the country is natural, in the city it is artificial. Panics come and panics go, but the forces of nature, obedient to the efforts of the tiller of the soil, go on forever.

While the financial troubles were sweeping over the land last fall, making paupers out of milionaires and crushing the life out of the city dwellers, who are ever in jeopardy from the upper and the nether millstones of high cost of living and low wages, the country dweller remained calm and unmindful of the life tragedies that were so much in evidence in the cities. The carefully cultivated fields returned crops which were unaffected by financial troubles, there was fruit in the orchards and fat kine in the feeding pens. The bulls and the bears in the wheat pit might juggle prices in their mad struggles for wealth, but the farmer had the grain, and if the price in the markets did not suit him he could eat it, keep it or feed it to his stock. It contained the raw material from which the "staff of life" is made, and it had for the farmer a value which even the market manipulators could not affect.

There are no "hard times" in the generally accepted sense of the term in the country, nor will there ever be so long as air, water, rich soil and the efforts of man combine in the production of crops which are not entirely at the mercy of the influences that cause the financial ruin of thousands and dire distress for millions whenever one of those periodical waves of depression sweep over the land. The country dweller, of course, enjoys varying degrees of prosperity, for no two seasons are exactly the same, but the changes, no matter how violent, fail to deprive him of his livlihood that the soil will always give him. It is during hard times in the city that the lure of the country becomes the strongest. The city is cold and cruel to the sons of men; the country is warm and kind. It can never be the scene of such life-and-death struggles as are ever going on in the crowded walks of the city. In the city the struggle for existence is between men. In the country it is between man and nature, and nature, always kind, yields easily to those who seek her conquest.

That the present movement back to the soil will continue is almost a certainty. Aside from the positive assurance of plenty of the necessities, and at least some of the luxuries of life, which have always been available to the country dweller, the recent establishment of the free delivery, rural telephone and other advantages have brought the country much nearer to the conveniences of the city than was possible to imagine twenty years ago. —San Jose Times.

The members of the Cloverdale Viticultural Club have voted to appropriate $1 per acre of wine grapes to be used in advancing the interests of light wine consumption.

Antelope, Sacramento county, will have a big pear crop this season.

Citrus Fruits in Colusa County

IN this orchard are 500 trees. They average 373 boxes per acre. The product was formerly taken by the Palace Hotel, which always wants the best. Owing to the worth of these and many other fruits it is claimed that Colusa county could support a population of 600,000 people. It now has 15,000. There is a chance to grow. It is only a sample of California possibilities.

COLUSA county is six hundred or more miles north of the great orange producing section of the State, yet the scene herewith gives visible proof that the orange is perfectly at home. Such proofs of the wonderful climate and products of this State are plentiful. This scene is almost in line with Springfield, Ill., Columbus, O.; Philadelphia, Pa., and considerably north of Washington. Yet the gentleman in his shirt sleeves and the unprotected fruit are apparently doing pretty well. Is it any wonder the whole world wants to come to California?

A Railway on the Ranch

An Elementary Lesson in Irrigation

Written by T. S. Van Dyke and Published in Irrigation Age. A Look at the First Mistakes

ABOUT all you know at first about irrigation is that it will cost too much to imitate rain. From which you quickly drift to the conclusion that the next best plan is to cover the ground with a sheet of water. You have a piece that looks very level and turn on a stream. But instead of spreading out, it slides off to one side, or collects in little pools with sloughs between. Or it may dish in the center, cut off from a ridge or slide off both sides. In any case it is likely to leave many dry spots, and their combined area will probably be too great to be ignored. Three solutions soon suggest themselves.

First to keep the water on long enough to allow the dry places to get wet by water soaking to the sides from the wet spots. If the dry spots are small and you are merely testing the fertility of the soil or in haste to get a few radishes or something of little value this may be the least objectionable of the three, for it may not have the water too deep or muddy unless you purposely make it so.

Number two, a special favorite with most tyros, consists in shoveling off the bumps while the water is running and throwing the loose dirt into the water in the low places. When the water goes down you find your uneven shoveling has tripled the number of bumps, and though none are as high as before they are still high enough in spite of the fact that you have raised the low places. And in the low places you have doubled or tripled the thickness of the paste that will bake under the hot sun and which, without your filling, would have been thick enough to stop many kinds of seed and sicken most of the plants that were strong enough to push through it.

Number three is a very choice method devised by those who discover the bad features of the other two. It is simply throwing up a levee around the piece high enough to raise water over all the high spots. You find it would not pay to shovel them off on a tract of any size even if you could do it, and also that increasing the quantity of water merely makes it cut more in the low places. The obvious thing is to back it up so as to cover. This is the origin of the "check" system, one of the leading systems of the world and one quite indispensable for many kinds of work. They are called "basins" by some; "borders" from the levees by others; "plots," "pans," etc., but "check" is the most common in all sections. "Basin" really belongs to a modified form in which only a part of the ground is wet instead of the whole.

Your selection of method number three may be very bad, as many plants cannot endure it no matter how well done. But assuming your choice all right you are quite certain to have grief in its details. The temptation to make the levee out of wet mud instead of waiting for the soil to dry after your first failure is quite irresistible when you are in haste to see something green or get a bite of fresh vegetables. On many soils such levees melt like mush when the water gets a few inches deep, and nearly all your attempts to repair them result only in more mush, more muddy water to form a paste inside, and final breaking in spite of you when the water is high enough.

If you wait and make them of dry soil you are quite apt to make them too thin, too loose with weeds, sticks and grass that may lead a small thread of water through, and so low that if the check is of any size the waves from the first wind will breach it. If your ground is so flat that a low, flimsy levee will suffice to hold water long it will probably mean that your ground generally is too flat for easy drainage and that the building of proper drainage ditches should precede any irrigation. For on many soils and for many plants a quick clearance of the water after being on long enough is essential. But you will naturally leave this discovery until after wasting a lot of time wondering why your stuff doesn't grow better.

Assuming that your levees hold and you have the highest points covered and some crop started, you may be surprised to find plants doing best on the highest parts. On the lowest parts they may not even have sprouted, being locked up tight under a blanket of paste. And even on the highest places they may look bad. It does not take you long to discover that the deeper the water the worse the results. This is due to some extent on most soils to the greater pressure tightening the soil and also to handling the water in such a way that it is muddy instead of clear, when the deepest parts get the most mud. Later on you may find that you have been wasting one-half or two-thirds of the water, because if the highest parts got enough to make a good growth of vegetation it is quite probable that the lowest parts had too much. From which you finally conclude that the whole should be graded down to a more uniform surface. A very sage conclusion, but you have little conception of the distance you are from the profitable part of its realization. You are quite apt to think that you have a fine eye to tell a level. But let me tell you that the longer a surveyor uses a fine level the more certain he will be to rely on the telescope and rod instead of his eye. There is but one thing of which you may feel sure, and that is that when you are looking toward high mountains, a level on the plains below will look down hill and a ditch running out from a cañon will seem to run uphill.

Relying on your eye you are quite sure to overlook such little trifles as a swell of two or three inches if it is broad enough. Or if you notice it you are quite likely to say it will amount to nothing and that the water will go over it anyhow. Still more certain you are to do this if the swell happens to be at the upper side where the water is delivered so that it will have to go over it to get into the check at all. This latter conclusion is all the worse because as long as the ground is bare it may be correct or nearly so. But when covered with a heavy stand of vegetation like grain or alfalfa it may collect all floating leaves or rubbish on its upper edge and throw the water off on the sides leaving a spot too dry when the rest of the field has enough. And in time this may become worse instead of better, the water swinging farther away and wasting in the lower places that would have enough without it. And this you may not notice until the growth becomes too valuable to change. This may happen when you are well aware of the necessity of perfect grading, for one is often inveigled into the snare through haste or anxiety to see something green. I have thirty acres of alfalfa scratched in hastily to get green pasture for the horses six years ago, although I knew better twenty years before that. It is the bane of my existence now, taking fully twice the water and work required by other tracts properly graded, yet paying too heavily to plow up. California is full of orchards in the same situation, for it is about equally bad under all methods of applying water. You may be fortunate if right here you make the worst sort of a failure. For in no other way can most people be made to understand the supreme importance of proper grading. Those who have been through the torment may talk and talk in vain. You will insist that the ground looks all right and is all right when nothing but the level, or leveling by water itself can tell you whether it is or not.

Proper grading is no serious matter if you only realize its importance at the outset and determine to allow nothing else. You do not have to make any large area flat or anywhere near it. But in whatever way you handle the water it should travel at a uniform velocity whether the head of water be large or small or whether it is to run a long time or a short time. And this does not have to be on one face or plane so as to shave off too much top soil. Even a small place may be laid out on several planes so that it can be evenly flooded, and, though in a certain sense this is like terracing, it may be quite free from the expense of terracing such as one commonly sees on hillside gardens.

It is impossible to go far into the subject of grading because it will vary so much with the area to be graded, the quality of the soil, the kind of vegetation on it and so many considerations. On the Mojave Desert in California I sweep brush, hillocks and everything with two large railroad bars slightly curved so as to keep the cutting edges down. One is set behind the other with strong chains and five or six horses are put on each end. With that power and two drivers I don't have to plow at all. Nor do I have to plow in making the checks. I first set four level stakes with the telescope and move the earth above that level with a carrying scraper and four horses abreast direct to the levees. The soil is so dry and loose that this is very easily done. The work is finally tested with water and then polished off with a grading machine when dry. Plowing, when unnecessary, is a nuisance because it increases so much the bulk of the soil that it is harder to work to the grade stakes.

But this would not do for many soils, while for small areas it might not pay to have such an outfit. A drag with a cutting and carrying edge is often better than the railroad iron if brush is not too heavy. But it should be so long and stiff that it will not climb bumps and sink into depressions, but shave the bumps and drop the shavings into the depressions. This should often be forty feet long and loaded with sand bags so as to take a dozen horses or more. No kind of a gouging scraper such as the common "slip scraper" will do good work, though on a small scale fair work may be done with the "buck scraper" by an expert. It may pay you at the start to have a good road grader, while for small garden work you had better grade with shovel and hoe than not at all. When you thoroughly realize its importance you will find a way to do it according to the size and quality of your soil, the value of your crop and the balance in bank. And beware how you try to economize on it for every dollar you save may cost you two or three without your knowing it.

You can now buy a fair level for $20, though

With the Citrus Growers

HEALTH AND DISEASE IN THE CITRUS TREE.

TO DEFINE health and disease, particularly as applied to cultivated plants, is by no means easy While we all have a general idea of the conditions indicated by these terms and conceive of the two as opposed to one another, one being that which the other is not, yet a definition of each and a sharp drawing of the line between them is quite difficult. In the case of commercial crops, and even more especially with citrus fruits, it is often true that the condition of the plant or the nature of its product most desired for commercial ends may not be synonymous at all with the normal, natural development which we ordinarily regard as health. On the other hand, an unproductive condition or the development of undesirable qualities may be most disastrous commercially, and yet not indicate a condition of disease or anything abnormal in the natural development of the plant. In other words, the perfection of desirable commercial qualities is by no means the same as perfect, normal, natural development or natural health. The fact is that the work of the plant pathologist in California, particularly in the case of citrus fruits, is not limited to the study of actual disease and the means of avoiding it. He is rather called upon to advance commercial perfection and learn how to overcome conditions which are undesirable from this standpoint, whether they be one of actual disease or not.

Disease in the ordinary sense is the effect of some cause or condition which interferes seriously with the normal functions of organic life. We commonly understand such a condition as one of a somewhat more complicated nature than that resulting from a simple injury.

The causes of plant diseases are many. Most important ordinarily, or at any rate most easily accounted for, are those which are caused by the action of what we call parasites. Parasites are living organisms, either of an animal or vegetable nature, which live at the expense of other individuals, usually growing closely associated with their tissues and drawing nourishment from them. The plant pathologist does not ordinarily undertake to investigate cases of parasitic injury caused by insects, as the subject of entomology has become a large and important one. Plant pathology is, in the usual sense, the study of all diseases or troubles with plants other than those caused by insects. The parasites with which the plant pathologist has to deal are mostly of a vegetable nature and are largely of the class known as fungi. The fungi are real plants of a low order of development, many of which are parasites to a greater or less extent upon other plants. A great majority of our best known plant diseases are caused by fungi, such as the rusts, mildew and many blights, rots, etc., from which very few of our commercial crops are free. A number of other plant diseases are caused by bacteria-organisms of a still lower class, forms of which are responsible for most of the serious animal diseases, but of which only a comparative few affect plants. Some of the most distinct bacterial plant diseases are the pear blight and walnut blight, both well known in California.

Aside from the troubles caused by parasites it is well known that plants are affected in most various manners by influences resulting from the conditions under which they grow. Vegetable life is dependent upon certain indispensable factors which, acting in the proper degree, contribute to the normal development of plants. These factors may also vary to a considerable extent, without seriously affecting the life or condition of the plant, but beyond certain limits their influence results in injury, or may go still farther and bring about a condition which may be classed as a disease. The factors to which we refer are those upon which all plant life depends, namely, moisture, temperature, light, chemical food elements and freedom from other influences which might cause injury. In regard to these different factors, their general influence upon plant life is well known. We are all aware, for instance, that water is indispensable, but that either too much or too little is injurious. Also that the same is true in regard to sunlight, heat, cold and chemical food elements. While an excess of any of these factors may produce a very evident injurious effect on the plant, scarcely different from a mechanical injury, yet, when relative conditions in regard to these essential factors become complicated, we may and often do get results upon plants which are strictly of the nature of disease with definite symptoms, in which it is very difficult to establish definitely a simple succession of cause and effect.

Not Natural Conditions.

We must further consider the fact brought out at the beginning of this paper that simply a condition of natural health is not sufficient to satisfy commercial requirements, but that certain definite standards are set up of quality and quantity of the product, some of which may be radically different from those which nature intended. From this standpoint the control of the effect of natural conditions upon cultivated plants may be of even greater importance in relation to these more or less artificial qualities than as simply affecting ordinary health. Horticultural conditions in California are of such a nature as to make this phase of the subject of particular importance.

Our crops are grown largely under conditions which are entirely artificial, the plants themselves being natives of other portions of the world, grown here in places where the conditions which nature ordinarily supplies are largely under the control of man. Two factors particularly, those of irrigation and fertilization, are of the greatest importance in this connection. In the citrus industry we plant a tree in a place where it would perish almost immediately without constant attention and have at our disposal to withhold or supply in any desired amount two of the most important factors in plant growth, water and soil food. The amount to be supplied, the time of application, frequency and many other most important considerations are very largely in the hands of the grower, and the growth of the tree, its health, life and development, as well as the quality and quantity of its fruit, depend almost entirely upon the manner in which the grower handles these controllable factors.

Unfavorable Conditions.

It is further to be said that there is

$10 a day may be earned by a man using our machinery. Some earn more. FULL LINE for prospecting for water, coal, mineral, oil, etc. Any DEPTH, any DIAMETER. PUMPS also. Free catalogue.

no tree more sensitive or easily affected by conditions of this sort than the orange or lemon.

To come more directly to the subject which we are expected to discuss, we may say in general that in our investigations of the diseases of citrus trees in California we have found no important citrus disease which is caused by any fungous or bacterial organism, or anything of that nature. If we except decay of the fruit and a very few exceptional cases of disease of the tree, the above statement may be made an absolute one. It is true beyond all question that our most serious troubles with citrus trees in California are the effects upon the tree of unfavorable natural conditions, and not those of active parasites. Some of these effects, it must be confessed, are at present most obscure and difficult or impossible to account for in any satisfactory manner. Yet the study of the various diseases and of the nature of the tree itself has been sufficient to show that this is true.

A Ring a Year.

In connection with the effect of natural conditions, such as temperature, moisture, food elements, etc., upon the growth of plants, two peculiarities of the citrus trees may be mentioned here. The first relates to its manner of growth. Most of our ordinary fruit trees are deciduous. Their life each year is marked by a period of growth during the summer and a period of rest during the winter. In their woody stems and branches the substance formed each year takes the form of an annual ring, the number of which corresponds very closely to the age of the tree. These rings are visible on acount of a difference in the structure of the wood formed in the spring and during the summer. At the beginning of each growing season large amounts of sap circulate in the tree and the first wood which forms at this time has a very coarse, porous structure, being composed of comparatively large open vessels which are mechanically adapted to conducting the large amounts of sap which are flowing at this time. As the season advances the woody growth in thickness becomes less, the amount of sap diminishes and the wood now formed has a closer, denser structure with much smaller vessels, until finally, toward the end of the summer, growth ceases altogether. The next spring another porous coarse layer is formed outside the fine grained wood of the previous fall, and from this difference in structure the annual rings are visible to the eye. The difference is also of importance, as just pointed out, from physiological reasons, the coarse-grained spring wood allowing the passage of the large amounts of sap which are flowing in the tree at that season.

Control of Growth.

In the citrus tree a number of growths takes place each year. Each of these is marked by a definite ring of wood in the stem and branches, so that if the tree makes five growths during the season, five rings will be found in the wood for that year. The fact pointed out above that the structure of the wood is of great importance as permitting or obstructing the flow of sap is the vital one in this connection. Citrus growth, while having a certain normal regularity under uniform conditions, responds in a very marked degree to the treatment which is given the tree, particularly that in respect to moisture. Growth naturally follows an abundant water supply and vice versa. If then the water supply should be extremely irregular disastrous results may follow from this peculiarity in the growth of the tree. During a period of dryness the woody tissue which serves as a channel for conducting the sap becomes dense, fine grained, and of poor conducting quality. If the tree is then suddenly supplied with a large amount of water its trunk and branches are not able to conduct that which is sent up from the roots and complications may result. Further than this the citrus tree is one in which the flow of sap from the roots is extremely free and abundant. One needs but to cut off the top of a vigorous orange or lemon tree and then supply the root abundantly with water to discover the remarkable freedom and promptness with which the excessive amount of water is sent up by the root into the trunk.

Gum.

The second peculiarity of the citrus tree alluded to above is one which shares with the cherry, peach, apricot and other stone fruits and a few other plants. This is a tendency to form and exude masses of a gummy substance as the result of injury or even from unfavorable natural conditions. The gumming is due to complicated physiological processes in the tree and occurs in the trees mentioned, often very profusely, from a great variety of causes. It may be due to mechanical injury, to the effects of fungi, as seen for instance in the peach blight, or simply to physiological derangements in the tree. The gumming disease may be likened to a form of indigestion, or in some degree to the abnormal activity of the mucous membranes seen in a person suffering from a cold.

CITRUS CULTURE IN FLORIDA.

As an indication of cultural methods in Florida, we quote from a Florida paper a part of a description of an orange grove:

This grove contains 750 acres of orange and grapefruit trees and is said to be the largest grove in the world. Whether this is true or not, it is certainly the largest in Florida and the most unique and interesting. Here is a grove that has never had a plow or cultivator of any kind inside of its broad gates, has never had one pound of fertilizer and yet is said to produce the largest percentage of fancy fruit and at least 95 per cent of brights. Not a forest tree of mature size was ever cut here, neither was there ever a fire on the ground, and the orange and grapefruit trees stand among monarch live oaks, magnolia and other original forest trees, nothing but the undergrowth of brush and vines having been cleared away. Nothing is burned here, as is the case in most of Florida farming. The grass is cut often and allowed to rot on the ground, and the leaves from the trees furnish the necessary natural fertilizer to produce the perfect fruit grown here. This land is very rich, as can easily be seen by the mammoth oaks and other trees. Many of these orange trees were never planted, but were budded on original wild orange and lemon trees that have no doubt grown in this wilderness for ages. The writer was particularly interested in this grove, because so many people in Florida, as well as elsewhere, think and thoroughly believe that all Florida land is so naturally poor that it will not produce anything without artificial fertilization.

ORANGES IN TEXAS.

The following from a San Antonio paper shows that the days of the California orange are numbered and that Texas will hereafter supply eastern markets with oranges. We have never heard of their being quoted in the market, but we note in the following that as one grower has gone from "Santa Clara in the San Joaquin Valley, the Land of Oranges," California must look to her laurels.

It is probable now that Santa Clara Valley will feel compensated for the statement which was made in a northern paper that Southern California is the prune center of the world. She was angered at being deprived of the glory of her prune production. Now comes this honor.

How long before this grower expects to wipe out California's thirty-million-dollar crop the paper does not say. The principal proof that Texas will win in this citrus production contest is the fact that real estate men there are getting letters asking about Texas land. The paper says:

"Texas is taking California's orange reputation away from it. This is becoming more and more evidenced every day by the increase in the number of letters received by the business men's club from people residing in California asking about the culture of citrus fruits in Texas. In the markets of the East and North, Texas oranges are fast taking the place of the California citrus fruit, and it is predicted by reputable business men and orange growers of the state that before many years have passed the Texas orange and lemon will be the best known on the market.

"The first California orange grower to brave the ire of the California people by picking Texas as the place in which to reside and raise the golden fruit was F. G. Hutchinson, who settled in Bee county recently and who has already started laying out and planting the largest orange ranch in the State. Mr. Hutchinsan came from Santa Clara, in the Joaquin Valley, the "land of oranges," as those not versed in what Texas can do and is doing, call it."

Imperial County Supervisors have enacted an ordinance providing a penalty for allowing Johnson grass to grow.

San Bernardino County Game Warden has recently released a number of Mexican grouse in the forest reserve.

J-M Asbestos Roofing

All kinds of Roofing at all prices. Write us before you buy ANY KIND

The roofing that is made of *asbestos* — an indestructible mineral — not affected by fire, rot, rust or stable fumes. The only roofing that has a natural white top surface and keeps buildings cool in summer and warm in winter.

It outwears all others because it is a *mineral* roofing, while others are made of organic and perishable materials. The cheapest roofing to use because it does not require coating or painting — the first cost the only expense — *no repair bills*. Easily applied — no skill necessary.

For Siding — Use Asbestoside

The most durable siding material known. Its natural white finish gives an attractive appearance without the expense of painting.

Deciduous Fruit Culture

WATER AND PLANTS.

A single leaf of an apple tree has 100,000 pores, and through each one of these pores water is continually passing off into surrounding atmosphere. Air has an enormous thirst for water, and the dryer the air the more water it consumes. When we stop to consider the way in which the atmosphere is constantly forcing not only the apple tree, but every other plant, to give up its moisture, the wonder is that after several days of hot sunshine, every plant does not wither and dry up. But, notwithstanding, those plants growing in light soils and exposed places seem to manage to withstand weeks of drought without even losing their greenness. But still more wonderful are the acacias and cacti, which not only grow but remain green out on the wastes of the fiery deserts in Africa and Arizona.

Plants have learned to adapt themselves to their situations, and to take precautions accordingly. Water to them is valuable, and where the supply is scanty they have learned to hoard it as carefully as a miser could his treasure. But they can not refuse to give up water altogether, for otherwise they could not grow. All their food is taken up by the roots, dissolved in water. The sap rises through their veins and feeds them. They make use of the mineral matter, and then let the water which contained it escape through their lungs (or leaves, more properly speaking).

If you pick a leaf from any plant or shrub—a hawthorn leaf, for example—it will be noticed that its upper side is much smoother than the under, which looks dull in comparison. This is because the upper side is exposed to direct rays of the sun. The glaze prevents the hot days sucking all the water out of the surface of the leaf. Some plants refuse entirely to part with water through the upper side of the leaf. Laurustinus and lilac leaves have no pores at all on the shiny upper surface of the leaves.

Pine trees inhabit dry, sandy soils. They refuse to grow wide leaves, but confine themselves to producing thick, fleshy needles, which have very few openings through which water can escape. Australia is the dryest of all continents, yet it has plenty of trees. But they never grow any more leaves than they absolutely need, and they seem to take the additional precaution of turning those leaves edgewise so that those water thieves, the sun rays, can not fall direct upon their broad surface. But the Australian acacias go a step farther. When they are fully grown they shed their leaves altogether; they keep the leaf stalk and produce two tiny wings, which present their edges to the sun.

Cabbages require an enormous amount of water, but unless the supply was absolutely unlimited their big leaves would give off so much to the air that, without some means of checking the over-liberality, they would wilt and die. Cut a fresh cabbage leaf and examine it. It has a sort of dusty, mealy look. Put the leaf under a microscope and you will see that this bloom is composed of tiny needles of wax. The cabbage has produced the wax to protect itself from the water-stealing rays of the sun.

In spite of these various precautions, the amount of water which growing plants part with to the air is almost beyond belief.

A square foot of long pasture grass gives off nearly four and two-fifths pints of water every twenty-four hours in dry weather. That is to say, there rises into the air 106 tons of water from each acre of meadow within the summer day and night.

One single cabbage has been measured to give off two and one-half pints of water within a similar period. As for the amount big trees give off, it is enormous. A sixty-foot elm will have 7,000,000 leaves. If spread out these would cover 200,000 square feet or five acres. From these leaves there pass out into the air within a summer day seven tons of water in the form of vapor.

THE APPLE SITUATION.

From an eastern correspondent who, from the very nature of his business is in close touch with the situation, the California Promotion Committee has obtained for the benefit of Californians the following report regarding the prospects for this season's apple crop in the East, and the knowledge will enable California growers to act intelligently in marketing their products:

"The New England States will have a total crop about equal to last year. In Maine and Connecticut the crop will be lighter, in Massachusetts about the same and in New Hampshire and Vermont heavier. New York promises another good crop. In the Valley of the Hudson River, proper, the quantity estimated is less than last year, but the western part of the State shows a big increase. The crop in Pennsylvania is the same as last year. In Ohio, Michigan and Wisconsin it is slightly heavier. The Middle West, where the principal shipments are Ben Davis, had very few apples last year, and the prospects this season are no better. Virginia, West Virginia and Maryland will do as well, or better than last season. California promises a big increase, and Oregon, Montana, Washington, Idaho, Mexico, Utah and Oklahoma will have twice as many as last season. The crop in Canada does not at present appear to be as large as last year, but if the fruit reaches normal size they will probably ship as many barrels. Nova Scotia had a large crop last year, and this year it will probably be less. Generally the quality of the different kinds promises good with the exception of Ben Davis, on which there is reported to be considerable scab. Taking the country as a whole the prospects are that there will be more apples than there were a year ago. These comparisons of prospects are based on the prospects of a year ago and, while we would not venture an opinion at the present regarding market values this fall, it would appear that apples will have to be purchased on a much lower basis than they were last year to allow speculators to realize any profits."

NUT GROWERS' CONVENTION.

The seventh annual convention of the National Nut Growers' Association will be held in Chattanooga, October 27-28-29, 1908. This gathering promises to be of particular importance to the industry. All members are urged to attend.

Let it be borne in mind that this convention is in the interest of general nut culture in all parts of the country, and although the pecan interests of the South may seem prominent, it but illustrates the potentialities of other sections and other nuts.

INVENTIVE GENIUS OF CALIFORNIA HORTICULTURISTS.

Commenting upon the inventive genius of California horticulturists and the application of this genius in useful machinery, Edward F. Adams, in the San Francisco Chronicle, says:

"Our horticulturists are, upon the average, without doubt, the most intelligent body of farmers, of equal number, to be found on earth. They are largely men of education and good training, who have been attracted to the fruit industry by sentimental reasons. Many of them graduated into horticulture from business life. The scarcity and dearness of labor, and the necessity of finding economical ways of cultivating their orchards and manipulating their fruit for sale in distant markets has sharpened their inventive faculties and made them pioneers in the practical arts of horticulture. We have forms of pruning saws and fruit ladders in common use which are not found elsewhere. We have devised machines for grading oranges and other fruits into sizes without injuring the fruit. We were pioneers in the use of refrigerator cars for shipping fruit long distances, and now we have devised machinery for cooling fruit before shipment. Some of our tools for cultivating orchards are peculiar to us, and we have the seeding machine which has revolutionized the raisin business. The spray pumps in general use were devised on this coast, and give better satisfaction than any which are imported from the East. In whatever ways good work or good results can be promoted by mechanical devices of any kind our orchardists have been skillful to invent and prompt to adopt."

WALNUTS.

The crop of the Persian walnut (Juglans regia) in the United States amounts to somewhat over $1,000,000 annually, yet the 17 or 18 other species of walnuts known to botanists are still growing wild with the exception of the very limited cultivation of the fine Japanese species. By hybridization and selection these wild nuts may be greatly improved and brought into cultivation. The wide extension of nut culture in all parts of the United States is also quite practicable by means of hybrids produced by the use of the hardy wild species. It is quite possible by this means to increase the nut resources of the country tenfold.

In Asia, South America, Australia and Africa are several genera of wild nutbearing trees, each genus represented by several species. Some of these nuts have a finer flavor than any nut grown in the United States today, are hardy and if properly handled by modern methods would add greatly to the wealth of the United States.

A few weeks ago we made a notice of a new variety of black cherries originated by Mr. Paul on his mountain ranch at Ukiah. Mr. Paul has sold the exclusive rights to his new cherry, which has been named the "Paul," to the Leonard Coates Nursery Company of Morganhill and stock will be available for the season of 1908-09. This cherry is highly recommended by Prof. Wickson, Burbank and others.

Pruning the roots has reference only to the bruised and broken portions. The more roots a young tree has the better; but the broken or bruised ones are a hindrance to growth for the time.

California Horticulturally

THE TABLE GRAPE SITUATION.

THE table grape is having its innings now and there is more attention being paid to it in the upper country than to any other fruit at the present time. Northern San Joaquin and Southern Sacramento counties are the centers of the table grape boom, for boom it is, and some of the stories of profits derived from this fruit are almost as incredible as were some of the stories told of profits from oranges in the early days of the citrus industry. Net returns of $200 and $250 per acre are common, while $300 is not surprising, and several vineyards were quoted to the writer in which the returns had been $500 per acre, over and above all expenditures. Now, that's pretty good. It is no wonder, in the face of such returns as these, that grape land is quoted at $1000 per acre, with little offered.

There is something in the soil or climate of the section mentioned, which seems especially adapted to the production of the Tokay grape, and this for the Eastern trade, is the grape par excellence. It is showy, the berries are large and their bright red, transluscent coloring makes them look like drops of sunshine; the clusters are large, and it is in all ways attractive to the eye, and the average man purchases on the recommendation of his sight. All these attractive qualities in the Tokay grape are produced in their fullest in the section of which Lodi is the center and which has a radius of some twenty miles, and from this section the great bulk of this fruit finds its way to the Eastern market. What the orange is to the southern part of the State the Tokap grape is to this section. Upon it depends the living and prosperity of thousands. Lodi and Acampo, both prosperous towns, and the former claiming to be something more than a town, have been practically built upon the output of table grapes, and there is not a more prosperous town in California than Lodi. People there talk grapes, think grapes and note every movement in the markets. They are prosperous and naturally want to remain so.

There are now some 7000 acres of table grapes, mostly Tokays, in bearing within the section of which Lodi is the center. All the products of these 7000 acres are shipped from Lodi. The demand in the East is sufficiently strong to absorb all the output at present, and there is little danger of a glut in the market so long as it is not greatly exceeded. But ahead of the growers there looms a dark cloud. There are nearly 20,000 acres of vineyards which have been set out in the past few years, which have not yet come into bearing, but which will soon be adding their output to that already going into the market. All of these added acres will be in bearing now in the course of two or three years, and the planting is still going on. The great question now troubling the grape growers of Lodi is: Will the market absorb all this added output at profitable prices, or will there be a slump on account of overproduction, and their profits be gone?

Already a movement is on foot to organize the table grape growers of Northern California, somewhat as the orange growers are organized, in order that there may be no oversupply rushed to any one market, and that the shippers may keep in constant touch with the markets. What is usually known as overproduction is really faulty distribution, the rushing of a larger amount of goods to one market than it can consume, while others which could use the surplus are left untouched. With effective organization this can be overcome and only so much of the products sent to any point as it can effectively consume. The Lodi grape growers appreciate this and are moving in the direction of organization for the protection of their markets before a distressing slump shall force upon them the necessity for such action.—John Isaac.

ANOTHER IMPORTED PEST.

Professor Woodworth, entomologist of the State University, has proclaimed the discovery of a new imported insect which he declares is even more to be dreaded than the White fly which caused the destruction of Marysville's citrus trees, her greatest beauty and her pride. Professor Woodworth states that this new pest is an ant which has been imported into the United States from Argentina, where it destroys everything before it, nothing being safe from its ravages. It appears in vast swarms and carries death and devastation in its track, even children have been attacked and destroyed by it. It has obtained a foothold in some of the southern States, and has now been found in an area of a mile square in Oakland. As it is a subterranean insect, and it was necessary to cut down the trees to get control of the White fly, it may be found necessary to raze the houses and dig out the basements to get rid of this. The matter has been passed up to the State Commisioner of Horticulture for action.

HEAVY FRESH FRUIT SHIPMENTS

The shipments of fresh fruits from Northern California this year will be unprecendented in the history of the fruit industry here. Already there has been shipped nearly as much as during the whole of last year and that was the heaviest shipping season up to that time.

We are now about in the middle of the shipping season, but owing to the coming in of Eastern fruit, California exports will probably drop off somewhat, allowing for this probability. It now looks as though the deciduous fruit shipments for the present season will greatly exceed 10,000 carloads. The principal shipments so far have been cherries, apricots, peaches and plums. Grapes are now coming on and there will be a very heavy crop of these to be disposed of. In addition to the old acreage there is a very large new acreage adding its output to the total. The deciduous fruit crop, too, has been exceptionally heavy this season and the canneries are running full handed to dispose of it.

Georgia and Florida nut growers effected a permanent organization at a meeting in Monticello, Fla., May 19 and 20.—W. C. Jones, of Cairo, Ga., was elected president; Ray C. Simpson, Monticello, Fla., secretary. The purpose of the organization is to promote the mutual interest of its members and to encourage the planting of nuts as a commercial enterprise.

Old crop raisins are being delivered to market very rapidly.

Ruddy Harvester Oil

For Harvesting Machines, Mowers, Hay Tedders, Feed Cutters, or any farm machinery, this will be found superior for all around use, and particularly on loose bearings. It is a heavy bodied oil, never turns rancid, never gums. Flows freely, no matter what the temperature. It lessens friction, saves wear and tear on horses and cuts down repair bills.

Put up in one and five gallon cans, half-barrels and barrels.

At all dealers in farm machinery.

STANDARD OIL COMPANY
(Incorporated)

Make $2,000 a Year Raising Sugar Beets

WE have claimed and have proved to a great many buyers that our land at Corcoran, was as GOOD as the BEST in the world for Sugar beets. Here is proof:

Mr. T. H. Schultz, 460 West Sixth Street, Long Beach, Cal., is known all over Southern California as one of the most successful Sugar Beet growers in California. Mr. Schultz went to Corcoran and thoroughly investigated our land, and so well was he satisfied that he bought a large tract and this year will plant the same to Sugar Beets, Mr. Schultz says:

"After a most careful investigation of the soil, climate conditions, water supply, etc., I am satisfied that I can not do better than to add a large tract of land in Corcoran, on the Pacific Farms Tract of land in Corcoran, to my holdings, and have done so, and I recommend this land to any buyer for sugar beet raising or for onion growing."

NOW doesn't it stand to reason that if our land is good enough for "experts" it is good enough for those just starting in—and is it not a wise move to be a near neighbor to those who know how?

YOU can make a success by going into the sugar beet raising industry, and you will make a success of it on our land.

PRICE of our land is $100 per acre, on easy terms. This price includes the water developed, the ditches made and the roads built, so that your tract fronts on a good road. Call or write for "Profitable Realty," our magazine which tells how to get an income for life in California.

202-6 Union Trust Building - Los Angeles, California
Member L. A. Chamber of Commerce

FLYFOE

That is just what it is. Sprayed on stock it kills or keeps off all those awful pests, flies, mosquitoes, gnats, etc. Do you realize what that means? Use it and note how much easier it is to keep your stock in condition and how comfortable they are. Sprayed on your cows the increased milk yield will many times pay for its cost. You should use something of the kind and

FLYFOE

will be found the most effective "fly bouncer" on the market.

If your dealer does not keep it, we will ship a 1-gallon can at $1.25 or a 5-gallon can for $5.00, and will prepay the freight. If not fully satisfied with it money refunded. Made by the

West Coast Mill
Los Angeles, California

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Irrigation and Forestry

USE OF WATER.

THIS paper on irrigation was read at a recent farmers' institute in Idaho. It contains advanced ideas on the proper use of water and will be of interest to those who irrigate.

At the Right Time.

Irrigation means the supplying of water in the right amount at the right time. Water is the one element necessary to plant life, which is under the control of man and the good irrigator can control plant growth with as much certainty, almost, as he can the shape of his building. The man who does not understand something of plant growth can never become a good irrigator. Water must be applied in a scientific and rational manner, because it is the lever which controls production. Moisture, air, heat and plant food are the elements which control plant growth. Water is the vehicle which carries food to the plant. Descending into the soil it dissolves the chemical food elements, and rising by capillary attraction, carries that food to the plant. Bear in mind that it is not the water going into the soil, but that coming up that feeds the plant.

A Chance for Air.

Plants should grow continually from the time the seed sprouts until they mature. If they are supplied with moisture in the right quantity and in the right way they will do so. If the soil is saturated with water to such an extent as to expel the air, the growth of the plant is checked. This is one reason why irrigation by the corrugation method, or in small trenches, is preferable to flooding. Bear in mind never to keep the soil saturated. Water in the soil forms in thin layers around the soil particles. If these particles are cubes with inch surfaces, there would be a film of water on all sides of the cubes. If this cube were pulverized or changed to a powder, there would be as many films as there are soil particles. Then a fine soil will hold more moisture than a coarse soil, because there are more interstices to be filled. Ten per cent of moisture in these interstices and a balance of air is about the ideal proportion.

Thus good cultivation, in having the soil well pulverized, is an aid to good irrigation.

The roots of a plant are always larger than its top. That is, the roots extend further into the ground than its top above it. The roots may run along near the surface or may be made to penetrate deep into the soil. If the soil is kept wet when the plants begin to show, their roots will keep near the surface. But if moisture is withheld, the plants will hunt for it, the same as an animal, and send their roots deep after it. The deeper the roots go the larger the feeding ground of the plant, and the thriftier the plant will be.

Water May Injure.

Thus, by the application of water, the irrigator may benefit or injure plant growth. A plant with roots near the surface will require frequent irrigation. One deep-rooted requires much less water. Thus by starting right the irrigator may either make or save himself work.

As between the corrugating or flooding methods, he preferred the former, for two reasons: A better and quicker distribution of water, and less liability of checking plant growth. In the corrugating or furrow method, furrows three or four inches deep, and two feet apart, should be made in the field immediately after planting, before the seeds sprout. These furrows readily conduct the water, carrying it across a field in much less time than when flooding is resorted to, and distribute the water more easily. The rise of an inch or two in a few square rods of ground is scarcely noticeable. Yet water cannot be forced upon such ground without impounding it by dams and making the low places too wet while the high ones are not getting moisture enough to make the plants grow. Where a furrow four inches deep is made through such high places the water flows without interuption, and soaks in about 12 hours from one corrugation to another, leaving the surface generally dry, and supplying the water to the roots where it is needed.

The best results are obtained in permanent ditches by placing spouts made by nailing lath together in the ditches to take the water from the ditch to the corrugation. One spout will supply two corrugations. These spouts should be placed in the side of the ditch, about one inch or so below the water-level, when the gates are closed. For instance, say the fall is two feet to the half-mile, and your ditch 18 inches deep. If the gate were put in at the lower end of the ditch it would back water up only three-fourths along or across the field. But being about 200 yards from the upper end of the ditch, and put in a gate that can be raised and lowered, not quite as high as the banks of the ditch, so that water will run over the headgate or as many as are required. The greater the fall, the more gates required. When you want water close the gates and raise the water above the spouts. When through, raise the gates, the water level falls, and the water harmlessly passes away. When ditches are constructed this way, it is a pleasure to irrigate and requires little time.

Begin Right.

In preparing your ground for irrigation (for permanent fields,) do it right. Made right once, it is always right. If no more than 10 acres can be prepared in one year, do it right, because it will pay in the long run. Have your land level. By level is meant free from knolls, with a slope. Water can not be made to run up hill. If the slope is too great run the corrugations around the slope in steep places or parallel with the ditches, as near as may be necessary, instead of from it. A fall of an inch to a rod makes a good flood for corrugations. When the land is quite level and has a gradual fall to the southeast, with the water coming upon the land at the highest point, the northeast corner, construct a ditch clear around the tract, with gates so that the water can be flowed westward and fed through spouts to the northern part of the field, the surplus part of the water passing away in the ditch on the west.

The surplus water on the field will be caught in a cross-ditch, a third of the way down the field, and may be used to water the central part of the field or allowed to waste in the ditch on the west, or if it is desired to water the middle or lower parts of the field, the water can be turned down the ditch to the east, and forced into either cross-ditch as desired, and the water confined to the land intended to be watered. If the field cannot be properly laid out without the services of an engineer, it will be much cheaper to get one than to try and get along in a slipshod manner by attempting to drive water where you want it with a shovel. Irrigating is easy where the ditches are properly laid out. Where they are not, it is slavery.

For Grain.

Unless the soil has moisture sufficient to bring grain up and keep it thriving until it is in the milky stage, irrigate before planting. Irrigate again in the milky stage, and with ordinary soil this should be sufficient to mature the crop. When the soil five or six inches below the surface will remain in a ball when squeezed in the hand, it does not need water. If not, it is time to irrigate.

Live Stock and Dairy

DECREASING COSTS.

A YEAR ago the probability seemed great that the milking machine would be in every large dairy by this time. Naturally we ask why the success has not been rapid? The next series of county fairs will bring the dairymen together and the agency people will also be there in force, and we will find out all about these things. The failure, from what I have been able to glean, of the dairymen to make use of the milking machines more largely lies in the fact that the skill to handle them has cost more than the price of butter could stand. The Danish government does not recommend a milking machine for the dairy milking less than fifty cows. We cannot make brains for men; the rise comes slowly in general intelligence along any line, and we must work with the brains of today. We have, however, in our milkers a class of men especially expert in their calling. The wages of milkers on a full string of cows run from $40.00 to $50.00 a month and board $18.00 added. This brings up the cost quickly on the cows that are loafing along. One question that seems strange is that on every hand we are trying to retrench and we find merchants' goods of every class cheaper; everything has come down except the farm hand. Wages are still $1.25 for men who are good workers.

Milk by the Pound.

When cows are shrinking in milk it has grown to be a custom in many dairies to pay the milker ten cents a hundred for any increase in milk. Many amusing experiences have grown out of this practice, for where the milkers are not watched the natural resource is to add water. One of Fresno's landmarks is Fulton Berry. He always had great pride in maintaining a high standard of food in his hotel. Milk did not suit him, therefore he put some cows on his ranch to furnish milk sweet and pure for his guests. The milk kept up in quantity but gradually it grew bluer and bluer, until on investigation it was found the men were watering it to save milking the cows. They were paid by the gallon and did not care. You remember the story of the boys filling the pump spout with turnips and then arousing the milkman from his sleep to tell him his best cow was choking to death on turnips? Everyone who has paid milkers by the pound without keeping a constant record of butterfat has been tricked in this way. These little things should amuse us and not worry, for in life we must learn to lift the grind of the wheels with a little oil of humor.

The Silo.

The way people worry amuses me at times. Just now the men on the ranch are divided and worrying over the silo filling. There are some that doubt the keeping—they are sure that it will all be wasted—that it is folly to dump all that good green corn fodder into that round tower to rot. The work of getting ready is being pushed. Every morning from six to nine or ten the men are coating the inside with coal tar. This coating prevents the action of the acid of the silage on the boards. The coal tar is cut by being stirred into gasoline. Then from three long ladder boards, crossed and tied to form a rough scaffolding, the men use whitewash brushes and daub it on from iron buckets. The hours for the work are made short as it is not easy to stay longer in the fumes of the gasoline. It becomes sickening—the same unpleasant stifling feeling that comes over one in the long tunnels following behind a couple of oil burning locomotives.

Promptness.

Filling a silo is like hay making—to be done at a minimum of cost only when plans are carefully laid and every team is made to count by falling into line exactly on time. The way to be sure of this is to be ready before beginning down to the smallest particular. The wagons and entire outfit are lined up in front of the blacksmith shop and Dad puts them right before the season opens. Every ranch seems to mave a Dad on it, some good, old fashioned trained man who can do general repairing from welding up to wagon wood work—one that the men in affection christen Dad. In a way his advice is received by every one. From the owner to the Chinese cook he has only friends. So Dad takes the wagons in charge. Every two-horse vineyard truck and all the small two-horse wagons are pressed into service. The two-horse wagons have the beds and reaches removed. Three sixteen-foot scantlings, two by fours, are chained to hang below the axles and then back of the wheels a rack six or eight feet high is placed; a like rack at the back is also put in but none on the sides. The Indian corn, as it is cut, is laid in bundles across the low bed. If two long ropes are used and the load built on them, it can be lifted off by hitching the team on the end of a stationary block and tackle at the cutter. This lengthened out wagon bed will hold as much Indian corn as three good horses can pull out of the field. The low vineyard trucks cannot be lengthened out as the wheels are already low and the bed would be on the ground. These trucks have beds or racks on the front and back and are widened by having outriders of plank on the sides.

Engine.

The cutter has been overhauled and now the engine is brought in from the irrigation and started up and its work tested. A couple of loads of fox tail is cut in to the silo to see that everything runs easy. Now is the time for the cutter. if it possesses any of the spirit of magnanimity to break down, for there is time now for repairs.

I sometimes think it would pay to sell a piece of machinery at the first break rather than repair it. The expense of repairs is considerable in a year but small compared to the loss of money incurred by teams and men waiting to start a job. I owned an engine once that stands in expense something like this: Annual repairs, including expert's time and car fares, $367; loss of time of men and teams as figured, $408. You see I could have buried that engine and got a new one with a year's guarantee of repairs and been no poorer off. The practical engine for my ranch has been proven (I have had nine others) to be the steam one.

First, it burned straw, then bundled brush and now the same old plant is burning crude oil. It goes from irrigation pump to straw cutting, to silo filling, to wood sawing, then to stemming raisins; all work comes alike to it.

Water.

The use of plenty of water in the silo ensures good settling and a soft succulency in all the silage. I saw some good looking silage last year that looked right; but in handling, the edges of the corn stalks proved to be hard and sharp. I wanted to see how the man feeding felt about silage. He at once complained it was not good feed, and he did not believe in it. I saw that the cows, which were not overfed, were leaving the silage and eating hay instead. I spoke to him about the sharp edges of the stalks and proposed he should get a wheelbarrow-load and we would pick out the sharp pieces. I was called away, however, by my host. I saw the man afterwards. He came to the ranch and told me he had thought it over and tried picking out the sharp pieces. The cows ate it well and he believed he had convinced the boss that the silage needed wetting. I have found water falling from an inch pipe rather too much at the bottom of the silo and about right at the top. Beginning with a half flow we increased it at the top until the faucet is at full flow. This is easier than to attempt to put the water in at the top by hoisting up the pails with a rope.

Corn Cutters.

A corn cutter would no doubt be a paying investment. I have never owned one, for the amount of money in tools on a ranch is appalling and I have never had it to spare at the corn season. We use the long knives that are in use in the vineyards for "slashing" vine ends when they grow too fast. Two men at the side of the wagon cut, catch in their arms and lay the bundle of corn across the low wagon as fast, nearly, as they can walk. When the teamster has his load he drives off and the next falls in line. Should any little hitch take place, then into the silo the men go to tramp the edges. Here a good singer comes in—and the men often roar out in hoarse tune as they tramp the silage down, "Tramp, tramp, the boys are marching."—M. E. Sherman.

MAKING OF BRAN MASH.

One of the most common of all feeds is the bran mash, yet not every one knows how one should be made. It is only in racing stables and large studs, as a rule, that one sees it done properly. To make a bran mash first wash out a bucket with boiling water, then pour in the quantity of water required. say three pints, and stir in three pounds of bran. Cover up and leave it for a couple of hours or more if not required for immediate use. A mash takes hours to get cold and is often given to a sick horse too hot and refused when it would have been taken if properly prepared and given warm instead of scalding hot. The addition of a tablespoonful of salt in the ordinary mash of a Saturday night can be recommended to keep down parasites and promote digestion, but should not be part of a sick horse's diet unless specially ordered. A mixture of linseed and bran is often prescribed, both as food and a poultice. To one part of linseed, two of bran is a desirable proportion for both purposes. To get all the feeding value out of linseed, several hours should be allowed for cooking, not merely infusing, as with a bran mash, but gently simmering on the side of the stove. The vessels should be filled and towards the end the lid may be taken off and evaporation permitted while cooking.—Journal of Agriculture.

Warranted to Give Satisfaction.
Gombault's
Caustic Balsam

Has Imitators But No Competitors.
A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.
As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.
Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE HORSE IN HOT WEATHER.

The average farm horse is usually a hard worked and poorly cared for animal. It is not at all uncommon to find horses' shoulders cruelly galled and yet they are kept at work during the hot days, and poorly fed and little or nothing is done to relieve their pain. In most cases these conditions could be easily prevented by proper care. A few hints, therefore, on the general care and management of the work horse may prove of value. A horse can do a maximum amount of work only under proper conditions. The right kind of feed and grooming, protection from flies and the proper adjustment of the harness bring about the desired result.

Good Feed.

The first rule in feeding is regularity. This is equally true of working. Do not feed much hay and be sure that what is fed is free from mold or dust of any kind. If dusty hay must be used if it is sprinkled with water just before feeding, bad effects will be prevented. The amount of grain fed must be determined by the feeder. Some horses are harder "keepers" than others and the quantity must be changed with the severity of the work. In all cases the heaviest feeding should be done at night. About one-half of the day's ration should be fed at this time. A bran mash given once a week is beneficial. If possible, a yard should be provided where the horses could be turned out in the evening to roll. This will do them more good than spending a half hour on each of them with a curry comb and brush and it is easier for you. Salt and charcoal should be placed in this yard so the horses can get it at will.

Shoulders.

During the hot weather the neck and shoulders should be thoroughly washed each evening in cold water to which a little salt has been added. This is the best remedy against collar boils and sore shoulders. It is also a very good plan, when resting in the field, to raise the collar from the shoulders so as to remove the pressure and allow the air to circulate. Some farmers take a barrel of water with them to the fields and give each horse a pailful once or twice each half day. This is certainlly an excellent thing to do, and it would be well if the practice were universal.

No Pad.

It would be a blessing to the horse kingdom if all horse owners could be convinced that the sweat pad is a bad thing, especially in hot weather. All sweat pads are made of material which draws and retains heat and moisture and when used in warm weather they are sure to leave the horse's shoulder in such condition that they will be easily galled. Throw away the sweat pads and have the collars properly fitted and the horses will feed and work better. A collar should fit snugly at the sides of the neck; and at the bottom there should be room enough so that you can pass your hand between the collar and the horse's neck. Do not have the collar so narrow that the shoulder muscles used in pulling can not have a firm contact.

Fitting the Collar.

In fitting a collar after you have one of the proper size the following method is good. Place the collar in water to soak over night. Next day put it on the horse on which it is to be used, put on harness and buckle hames up properly and then work the horse until the collar is dry. This will shape the face of the collar to fit the horse's shoulder exactly. After the collars have been thus fitted be sure to never change them around. After it has been fitted the surface should be polished to reduce the ill effects of friction. To do this make a heavy lather with a good soap, apply to surface and rub with a good hardwood stick. The collars should be well cleaned each evening after they are removed. A hardwood stick is preferable for this. Never scrape a collar with a knife as it makes the surface rough. When the collar is not in use always have it buckled at the place of adjustment and hung up. Good stiff leather or zinc bridges should be used at the top of the collar. The yoke strap ring at the back of the belly band should connect with the straps from the crupper or breeching. Many think that breeching and crupper straps are unnecessary, but remember it is important that the harness should fit snugly though not tightly. The above mentioned straps are for that purpose. The harness should be kept well oiled so it will adapt itself to the horse easily. Always use wide and comparatively thin straps rather than narrow and thick ones.

Flies.

Not of least importance in properly caring for the horse is the protection against flies. We have known men to work their horses all through fly season without an attempt at such protection. This is cruel and inhuman. There are three portions of the horse, where flies bite excessively; about the ears and neck, the belly and the legs. These parts should be protected as much as possible by means of proper nets. There are various preparations on the market which are applied to the horses in the form of a spray, which are said to keep flies away, but it is doubtful if they will prove practical for the average horse owner. The kind of net to be used will depend largely on the owner of the horse. A good leather net is probably the most economical. Be sure to get a net with long strings to afford protection to the legs. White muslin blankets with holes cut on each side, well up towards the backbone to permit of ventilation, make very satisfactory fly protection. In fact many prefer them to nets. It is claimed that they are as cool as nets and afford as good or better protection. These are matters, however, which must be decided by each individual himself. Look well to the comfort of your horse. He is your faithful servant and will repay you for good care and kind treatment in long years of usefulness. —Pacific Homestead.

TEACHING COLTS TO EAT.

The following advice given to me by my old teacher I have found in rearing over fifty colts to be absolutely true, and I hope it may help some other horseman. While the mare is nursing her colt, feed her once a day on hay cut in inch lengths, mixed with bran, shorts or other ground feed and moistened with water, just enough to make it adhere to the hay and not be sloppy.

Arrange the feed box so the colt can learn to eat with the mare. In this way, by weaning time, he will be able to keep his colt flesh, and weaning will not hurt him. A little of this feed will digest easily, is economical, will distend his stomach, and, if followed until he is 4 or 5 years old, when his digestive organs are in perfect working order he will be practically immune from colic or stomach trouble.

THE BOAR.

In the first place, get a good one. Get the breed that best suits your needs and stick to it. If you can't trust your judgment in selecting a boar, then rely on some reliable breeder. Expect to pay a good price for a good hog. You can't get something for nothing. If you can pick up a good mature boar that a neighbor has to get rid of—see that there is no disease—then you can use him at once. But the usual way is to get a mere pig.

The boar pig must be fed so that he will develop symmetrically and come up to your expectations. Pedigree will not make a good hog out of a pig poorly nourished. If you neglect feed and care, then don't blame the breeder who sold you the pig, if you fail to get good returns for your money.

Give the boar a well fenced yard—not less than quarter acre—all by himself. It should be well drained if possible, shaded by trees or a shade built. Have a comfortable little house that can be kept clean and a feeding floor on which is the trough. Ashes, charcoal and salt should always be available. Keep the lot and house clean. Whitewash and spray the house with disinfectants to prevent disease. Burn the old bedding frequently and put in fresh.

The feed should be succulent at all seasons. Soiling is possible in summer if pasture cannot be given. Roots, pumpkins or silage will do for winter. In addition to the succulence, feed a good ration that will produce growth without excessive fat. Very little corn or barley should be fed to a growing boar except in winter, when about one-third or half of the grain may be corn, the rest shorts or highly nitrogenous feeds. Vary the ration, but keep the balance. Clover and alfalfa hay will be readily eaten *dry*, which can be put in a feed rack or it may be cut and mixed with the slop after soaking. These hays give bulk and protein at the same time and are good bone makers.

Make the boar take exercise by feeding him as far from the house as possible, especially during the breeding season. Have a breeding pen and limit the service if you want him to last. A boar should not be sold as soon as the season is over and a new young boar bought the next time needed. When you get a good sire, keep him and use him, even to the extent of in-breeding. Less harm will come from it than continually using an immature animal.—Successful Farming.

DISEASE OF SCOURS APPEARS SUDDENLY.

Scours or calf cholera in many instances differs from diarrhoea in the adults and has special features of its own, taking the form of infectious intestinal catarrh, which is far more serious than the ordinary diarrhoea of the full grown animal. This disease generally appears suddenly. A perfectly healthy calf may be seized all at once, apparently, without any change in food or care. The symptoms of this infantile diarrhoea usually appear during the first two or three weeks of life. In many cases it appears within a few hours after the animal is born, and the calf may die within from twenty-four to forty-eight hours.

It is common for the calf to be afflicted with scours immediately at birth, even before it has had time to suck or take any nourishment whatever.

The faeces or manure are very thin and watery. They have a sour dis-

MORE MILK—MORE MEAT

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.

agreeable odor and are usually light colored. The evacuations are frequent and expelled with force.

The first indication of the presence of the disease is the soiled condition of the tail, loss of appetite, sunken eyes, sometimes the saliva flowing from the mouth, no attempt being made to swallow it. They have a staring coat, grow thin and lose strength rapidly. Death usually follows in from twelve to twenty-four hours, unless prompt measures are taken to check the disease. If allowed to continue for any length of time the scouring will be accompanied by congestion and ulceration of the intestinal mucous membrane caused by the irritating secretions. As a result of this disease partial or total blindness is sometimes brought on.

To prevent scours in calves proper care should be given to the mother while pregnant, that she may be able to give birth to a healthy calf. As it is a germ disease, it is very important that the calf have none of these germs in its system before it is born. Calves from mothers which are affected with the disease of abortion are most apt to die of scours. It is, therefore, very necessary that the cows be kept free from the disease. Calves born infected with the germs of this disease in their system are in a position to spread the disease to other calves that they may come in contact with in the same herd, or if shipped to other herds. This is another proof of its infectious nature.

The most important factor in the raising of cattle is their care while young.

Do not think that you are doing the correct thing if you are only managing to keep the life in the calf until it is three months old, and then have it get fat on grass before the winter comes. If you do this you will be apt to have a lot of "scraws" with their digestive organs destroyed and which will never make strong, healthy steers or cows and will not be good for either dairy, beef or breeding animals.—Dr. David Roberts, Wisconsin State Veterinarian.

HUMANE CATTLE KILLING.

Consul Maxwell Blake reports that in spite of much initial opposition on the part of Scotch cattle killers of the poleax style, a new device is being introduced in the Dunfermline slaughter house as a humane substitute for the old style of killing. The consul describes the new instrument as follows:

The weapon is about a foot in length. The barrel is rifled and the muzzle shaped like the mouth of a bell and angled in order to adapt itself to the slope of a bullock's head. By unscrewing the opposite end from the muzzle the cartridge may be inserted. The breech piece having been readjusted, there is a steel guard protecting the hammer, which sets off the bullet. This guard is not displaced until the weapon is about to be used. When the bullock has been firmly drawn up, the operator places the bell well up on the forehead, and with a sharp tap of a mallet all is over, the beast generally falling down without a struggle. If the bullet has been properly placed, its path should be along the spinal cord, completely severing it. If the instrument has not been well placed, death is a little longer in ensuing, but in any case there is no pain to the animal. Care in the use of the weapon is all that is required, as it is not a thing which can be handled recklessly with impunity.—Scientific American.

Wood Soled Boots and Shoes. Boots, $3.25; Shoes, $2.00. O. J. Weber Co., 555 South Los Angeles St., Los Angeles, Cal.

HOG NOTES.

See to it that the pigs have plenty of salt, charcoal and sulphur.

Keep the little pigs growing. Do not let them be at a standstill for a single day.

Hot dirty pens will take more off from your pigs, than you can put on with a month's feeding.

Pigs do not trouble pasture fences ordinarily when the feed within is sufficient to supply their needs.

Weed out the sows that persistently fail to grow good litters. They may make better pork than they did mothers.

Little pigs do best when they have plenty of "run" in a large pasture where tender, appetizing feed is plentiful.

If there are no trees in the pasture, provide some other kind of shade for the hogs. Otherwise you'll have several cases of skin disease on your hands.

Coarse bulky feeds are best for pigs at this time as they distend the digestive systems, and get them ready to handle large quantities of fattening feeds in the fall.

Loose wire fences are great teachers and trainers of little pigs. It will be only a question of time until they can surmount, go through or go under almost any fence.

Boys sometimes itch to go hunting but when pigs itch or rub it is time for the farmer to go hunting the dip can and kill off hog lice and mange. This is safe hunting and the reward is always sure.

DAIRY SHOW.

The Third Annual Dairy Show will be held at Chicago and in the Coliseum, Dec. 2nd to 10th inclusive.

The purpose is to make this exhibition of cattle and machinery something more than a show. It is the purpose to make it a strong educational affair where questions of national import may be discussed and plans made for a greater development of all dairy interests. The first two shows were a success, and it is the desire to make the coming one better, bigger and more instructive.

The address of the association is 154 Washington St., Room 307, Chicago, Ill.

Why do not more of the cattle raising farmers combine for the purchase of a good bull? By so doing they would be able to purchase the breeder's best calf instead of his poorest. True, co-operation is sometimes unsatisfactory; each member under the co-operative arrangement has a will of his own that he wishes to cater to, but such minor eccentricities should be put aside for the sake of economy and better results. In this western country where more freedom and less restraint exist than anywhere else in the civilized world it is often very difficult, if not impossible, to get a half dozen farmers in the same community to agree even upon the same breed, to say nothing of the same type and quality. This condition will lessen as crease. "United we stand, divided we may stumble," should be the motto of development and competition in all breeders.

County Veterinarian Hunter says that between fifty and sixty thousand sheep have been dipped in various parts of Santa Clara county.

Heaviest grain crop in years, is reported in many sections of Colusa county.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

EXCLUSIVE Tubular ADVANTAGES No 5

EASE OF OPERATION

Lest you forget, we review the four previous exclusive advantages we have mentioned.

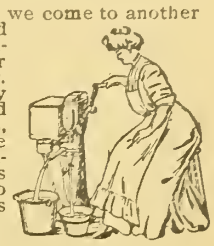
No. 1. The light, Suspended Bowl.

No. 2. The Low Supply Tank.

No. 3. The Perfect Self-Oiling arrangement.

No. 4. Ease of Cleaning, 3 minutes to wash the 3-piece, light Tubular Bowl.

No. 5. Now, we come to another important and exclusive advantage in favor of the Tubular. Having so many less parts, and what few it has, being of the simplest construction, means less weight to turn and less friction.



Let your wife test the easy running Tubular in comparison to others, and see what she says. Remember, we've been making Tubulars for 28 years. That means skill and perfect workmanship.

Write a postal for Catalog No. 260; it will open your eyes on separator building.

STANDARD OIL CASE.

The suit under the Elkins law against the Staudard Oil Company was begun in October, 1906, at Findlay, Ohio. In March, 1907, the particular suit in which the Judge Landis opinion was rendered was begun in Chicago and the Company was found guilty in April. In August the maximum penalty, amounting to $29,240,000, was levied by Judge Landis. On July 22, 1908, the United States Circuit Court of Appeals set aside the fine and reversed the lower court by unanimous decision. The President has directed the Attorney-General to take immediate steps for a retrial of the case.

The reversal of the decision did not in any sense touch the merits of the case except in-so-far as the size of the fine was concerned. There is no doubt of the guilt of the defendant or of the exceptionally grave character of the offense. The President regards it as a gross miscarriage of justice if, through technicalities, the defendant escapes puuishment, and will do everything in his power to avert such miscarriage. In his turn, Judge Grosscup, of the United States Circuit Court of Appeals, says: "Corporations should be made so secure as a form of holding property that the corporate domain of the country will invite investment by the people, just as the farms of the country are distributed among the people. I would like to see every clerk, every mechanic and every other kind of employee have a proprietary interest in the enterprise to which he is attached, and this can be done if we go about the work of corporate reconstruction sanely and reconstructively."

The decision of Judge Landis was held to indicate that great corporations were face to face with the majesty of the law. The reversal of this opinion by the higher court does not change their position. The prosecution will go on and no matter what the ultimate result may be, the American people will bow to the supremacy of law. If the present law is not sufficient, legislation will make one that can control public corporations.

We have little patience with the subsidized railroad organ praising with undue vehemence the decision of one court while aiming to discredit the honest though possibly erroneous opinion of another. We have little patience with the yellow press declaring justice blind and courts subject to venal considerations. Between the two extremes stands the great mass of intelligent American voters on whom rests the security of our government. They will rise to any occasion necessitating preservation of peace and maintenance of right and say to either extremist, thus far and no farther.

It is unfortunate, to say the least, that it is not now true that the corporations of this country are so managed as to invite investment by people of small means. But existing conditions will be changed under the law and with the fullest respect to property rights.

WASTING WATER.

As has been the case since irrigation began, the farmers are still engaged in wasting water. We do not say this from any knowledge of a specific case, but from the general knowledge of methods of work among irrigators. The waste begins in the winter time when the floods rush unchecked to the sea; later in the orchard, which was not prepared to receive the falling rain, or when plowing is delayed until weeds have exhausted a large part of the supply which fell from the sky; still again, by not properly packing the subsoil and holding the moisture which was in part saved by the late plowing; and more by faulty methods of irrigation with a scant supply which is given to many farmers this year. There is much to be learned in the question of irrigation and the diverse methods which are followed show need of study and observation on the part of irrigators. One man will run water for 36 hours while his neighbor on similar soil adjoining will get as good results with 24 or possibly 12 hours' run. Auother irrigates two or three times during the season, while his ueighbor must irrigate every two or three weeks to keep his crop in the best of condition. We have no pet scheme to suggest. In fact, there is uone, for the varying conditions which confront the farmers must be studied and every farmer adapt scientific methods to his own circumstances. Here let us suggest that this word "scientific" should not be the bugbear which to many men it seems to be. Let it be suggested to some farmer that he follow a more scientific plan of work and almost immediately his hands are in the air iu horror at that term. But until he learns to apply these principles to his own conditions, no farmer will achieve highest success with any crop he may attempt to raise.

Aloug this line we believe every farmer iu this State should study the principles underlying so-called "dry farming," or, as some prefer, "arid farmiug" operations. Whether one irrigates or otherwise, we believe these principles are of great value aud can be applied to auy crop or any orchard grown iu this State.

EVEN FOR A FARMER.

The Cultivator is in receipt of a letter from a valued subscriber asking where the boy of the family may secure an agricultural education. He has just fiuished grammar school and does not care to attend high school. But the parent adds, "Yet we feel that he ought to have a little more education, even if he wants to be a farmer." Of course the Agricultural College of the State University is not the place for such a boy, for a grammar school does not advance him sufficiently for entrance to that institution. It is probable that the State Polytechnic School at San Luis Obispo offers him the desired opening.

But the point in the letter which calls for mention of this fact on this page is in the words "EVEN if he wants to be a farmer." That expression, we believe, is only an indication of the feeling quite general amongst farmers the State over. If our sons and daughters aspire to be lawyers or doctors, or are going into the city to compete there in the life race, then every point is strained in order to give them an education just as good as the "city folks" are giving to their sons and daughters. A more vital mistake was never made than in this valuation which farmers put upon their own calling. If any class of people are entitled to, and even required, to have the best of education to secure the highest results, it surely is the farming class. The various problems of soil chemistry, the physical condition of the soil, insect, fungous and bacterial life, injurious or beneficial, the manner in which plants feed and grow, their climate requirements and a thousand and one other questions are confronting the farmer every day. To be sure, some of the most ignorant of farmers have often succeeded in farming operations through their inherent "horse sense" guiding them in the ordinary operations of farm work. Such men are usually natural money makers and have not succeeded because of their ignorance, but in spite of it.

It seems to us that these complicated questions facing soil culturists are such that our brightest young people should thoroughly fit themselves to meet these diverse conditions and not enter life hadicapped by having untrained minds which are not qualified to solve these problems. The time was when "main strength and awkwardness" were sufficient to win a living from the soil, but these opportunities are growing less and less every day.

The best is none too good, "even for a farmer."

ELEMENTARY LESSON IN IRRIGATION.

Continued from page 99.

you had better pay twice that. Its use is no such great trick as is commonly imagined. Any boy or girl of 15 can soon learn to use it well enough, and so can any man, no matter how old, if he can add and subtract two figures. No irrigated ranch should, under any circumstances, be laid out without it, and if necessary neighbors should club together and buy one. For small work a carpenter's level fitted with fine rifle sights does fair work if the rod is not over twenty feet away. Errors will amount to nothing if distance of the rod is reduced to ten feet, as most of them will balance each other. Instead of having a rod reading in feet and inches, or feet and tenths of a foot, have it all in inches. The elevation of the telescope will average about four feet above ground while the variation of levels will not be over two feet. A rod with the figures starting at three feet above grouud and running to five feet will thus give you tweuty-four inches which cau be marked off in ink if you have no black paint handy. The remainder of the problem, after adjusting the telescope, is about as intricate as going uptown with 24 cents, buying a 5-cent cigar, finding a dime and then figuring out your balance in pocket. There is absolutely no excuse for neglecting it because you can't afford to hire a surveyor and have on your tongue's end the old stock lie "can't teach an old dog new tricks." Maybe you have seen the man who can't write his name. His excuse is "didn't have no schoolin'." The combination of nine letters that make up John Smith is entirely too great for him. But he has not the slightest difficulty with the thirteen cards that make up a suit and the combinations that make a poker hand. Don't imagine you can't run a level because you did not go to a polytechnic school. Get one and don't lay out a ditch or a bit of land without it. Leveling by the water is too slow where the soil takes much time to dry. The carpenter's level on a beam to be dragged around or an upright on the beam with a plumb bob hanging from it, or the plum bob hanging from the top of a big triangle will do fair work on a small scale, but for work of any size the telescope will soon save you in time and bother all it costs to buy and learn to use it.

Agricultural Notes of the Pacific Coast

Northern California

Ferndale, Humboldt county, is planning for its coming fair.

Chico alfalfa prices are $6.50 to $7.00 per ton in the stack.

Sutter county fruit buyers are offering $25 per ton for cling peaches.

Seventy thousand brook trout were recently released in the upper Feather River.

Sonoma apple crop will be exceptionally large but the fruit is unsatisfactory in size.

Sutter county prune growers are reporting the loss by dropping of prunes as quite serious.

The Armsby Preserving Company commenced its fall canning campaign at Yuba City on the 17th.

Soil experts Dorsey and Mackie are investigating soil conditions near Yuba City, Sutter county.

Nearly 50 families are camping in tents at the grounds of Yuba City fruit cannery, Sutter county.

California Fruit Canners' Association opened its cannery at Marysville, Yuba county, the middle of the month.

The Sacramento Valley Sugar Company will commence operations at Hamilton, Glenn county, on August 1st.

Harvesting fruit at Chico, Butte county, is progressing satisfactorily with sufficient laborers to handle the output.

Early peach growers are generally drying their own peaches, owing to unsatisfactory prices offered for the green fruit.

Orland, Glenn county, reports a shortage of only about 25 per cent in its yield of grain, which is of very fine quality.

The bills of sheep inspectors of Yuba county have finally been allowed after having been held up on technical grounds.

Owing to low water, navigation of the upper Feather River has ceased, compelling producers to depend on rail transportation.

The grain harvest of Sutter county has been practically finished. Wheat is now selling at $1.50 to $1.60 and barley $1.05 and $1.10.

Sonoma County Co-operative Poultry Association has raised its local price, quoting now at only 1½ cent below the San Francisco prices.

Grain is pouring into the warehouses of Dixon, Solano county, at a rapid rate and the output wil be far in excess of earlier expectations.

Sonoma county is facing a shortage of barley. At one time a few days ago it was claimed there was hardly a sack, whole or rolled, in the entire county.

Placerville, Eldorado county, pears are of exceptionally high quality this season, there being very little scab and small proportion of wormy fruit. Prices are satisfactory.

Banner shipment of fruit through Sacramento was on July 1st, on which day 61 cars were sent on their way to eastern markets. The largest prior record was 49 cars in one day.

California Fruit Distributors recently forwarded 45 cars of fresh green fruits in one day. This is the largest green deciduous shipment by any one concern in the history of the State.

Central California

Del Rey, Fresno county, shipped its first Thompson Seedless the first of the month.

The cost of hauling potatoes from farm to market in California is said to be 16 2-3 cents per ton mile.

Gilroy, Santa Clara county, hay will be the finest ever, as it is quite short, but the yield will be light.

Fosters and Tuscans are being shipped in large quantities from Parlier, Fresno county, to the Fresno cannery.

Hatfield, the self claimed "rain maker," has recently been telling how he secures the precipitation of rain.

County Entomologist Morris of Santa Clara county addressed the grange at San Jose recently on the red ant pest.

About fifty million gallons of wine were produced in this State during 1907. Less than one-fourth of this amount has already been distributed.

The Maple Grove Creamery at Hanford has received the contract for 100,000 pounds of butter. This is a compliment to Kings county dairymen.

An irrigation system in Santa Clara valley, the Madrone Water Company, is about ready to turn water on a large tract of formerly unirrigated land.

Farmers at Prunedale, Monterey county, are urging the Board of Supervisors to legislate against ground squirrels, which have become a veritable pest.

Lodi, San Joaquin county, is just establishing a grape juice factory which it is thought will take up a large quantity of the inferior grapes of that section.

Discovery of a new pest, the Argentine ant, is reported by the State Experiment Station, a colony being found near Oakland and also in the Santa Clara Valley.

The waters of Tulare Lake are receding rapidly and grain will be sown this fall on much land which for the last two or three years has been covered with water.

Refusal to be stampeded and sell fruit at ruinous prices has resulted in the growers of San Joaquin valley securing better returns than appeared at the opening of the season.

The stockholders of the Salinas Creamery at Salinas have recently received a dividend of 8 per cent. This creamery has paid dividends every year since it was started.

Forest rangers are proposing to make an example of every one who violates the forestry law which places a penalty of $25 to $500 for carelessness in starting forest or field fires.

The Horticultural Commissioner of Monterey county reports that the fruit growers of that section have been very prompt this season in spraying for fruit pests and the fruit will be of very fine quality this year.

Congressman Needham is distributing sample packages of Tangier peas which it is claimed has been remarkably satisfactory both as a winter crop and as a green manure or cover crop. Farmers should apply for this seed so as to secure it before September 15. Congressman Needham's address is Modesto.

Southern California

Ventura county is agitating a good roads movement.

Imperial valley is busy planting quantities of corn.

The canncry at Pomona is already running on peaches.

Orange county apiarists are marketing a fine quality of honey.

Canning has begun on peaches and a good crop is being marketed.

Anaheim ships about 350 cases of 30 boxes each of raspberries daily.

Ventura county beans are not looking so well as last year at this date.

Chino recently shipped 280 head of fat cattle to the Los Angeles markets in one shipment.

Spraying of celery to prevent blight will be general in all the celery fields of Orange county.

Oxnard sugar factory which was recently started is reported to be running very smoothly this season.

Celery planting has just begun on the peat lands of Orange county. About 3000 acres will be planted.

Riverside citrus shipments aggregate about 5000 cars, less than 400 of which are lemons.

Apricots at Ontario were badly smutted this year because of orchardists not properly spraying the trees.

Nearly all apricot dryers in Southern California have finished the season and are now waiting for peaches.

Youngsters burning out bees to get honey started a fire which destroyed a young eucalyptus grove at Whittier.

Ontario has over 500 hands at work in her cannery, which is the largest force ever employed there at one time.

Grain heading has been completed in Yucaipa valley. The amount harvested will be fully as great as last year.

Hesperia supply of wood which was thought to be almost inexhaustible is now estimated to have in sight only about 6000 cords.

Tree Warden Reed of Riverside is offering a number of cash premiums for the finest lawns and handsomest shade trees of that city.

Water's Cannery Company at Pomona has finished on blackberries and apricots, using 325 tons, the largest tonnage of these fruits of any one year.

The Kingsbury Preserving Company at Redlands has shipped 40,000 pounds of its fancy marmalades to Denver. This concern is proving a profitable industry for that place.

Imperial valley has shipped, to the present time, over 1700 cars of cantaloupes, which it is now feared will not bring one penny of income to the producers owing to the serious slump in markets.

Forester Pinchot arrived from Washington recently and has inspected forestry conditions of Southern California and attended the meeting of the Tri-Counties Re-Forestation Committee at Riverside last week.

The wild turkeys recently released in the mountains back of Redlands have created a suspicion that they are nothing more nor less than tame turkeys. In any case they prefer the nearest barnyards to the range of the mountains.

The Coast

Natches valley, Oregon, is marketing an exceptionally heavy crop of potatoes.

Moro county, Oregon, will give a crop of grain considerably short of that of last year.

Miles of grain were leveled by a severe hail storm which visited Idaho in the neighborhood of Grangeville last week.

Le Grande, Oregon, hopes to give an average crop of grain this season, but has been somewhat alarmed by shortage of rain.

Crops in Walla Walla, Washington, have been seriously injured by drought which prevailed nearly up to the middle of July.

The cherry show held at the Dalles, Oregon, was one of the most successful ever given by this organization. There were forty-four exhibits of cherries.

A convention of logged-off land owners, recently held at Everrett, Washington, discussed manner of clearing and making tillable land of that section.

Wenatchee valley, Washington, was favored with an exceedingly heavy rain July 14 and 15, and the farmers express it as being "worth $100,000 a minute."

The State of Washington will be represented at the National Irrigation Congress to be held at Albuquerque by a full delegation, which has already been appointed.

The sugar cane plantations of the Hawaiian Islands are seriously affected with the cane borer for which a remedy has been sought in the form of parasites.

The Utah Agricultural College has conducted what it calls a dry farm excursion, leaving Salt Lake City and taking in several of the principal dry farming sections of that State.

The Grangers of Pullman, Washington, recently held a big grange picnic at which valuable premiums were awarded to the best housekeepers. The contest was very spirited.

"Red Hot" is the name of a disease which is attacking the stalk of the sugar cane. It has been found to be a fungus and is being studied by the Department of Agriculture.

A standard of fruit grades has been established by the fruit associations at North Yakima, Washington. Lack of uniformity in the various packing houses has been confusing to buyers in the past.

The cannery combine of Oregon is endeavoring to buy up cherries for three years, at a price "to be fixed by general market conditions." The sellers seem to think there is a colored gentleman in the woodpile.

Canneries of the northwest are busy denying the charge that they have formed a trust or combine. but the proof seems to be sufficient to make most of the farmers think that at least a "gentlemen's agreement" prevails.

At a meeting of the directors of the Portland County Club and Live Stock Association, it was decided to hold a poultry show in connection with the first annual Pacific National Live Stock meeting to be held in Portland, December 21-26.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Coulson's Cresolene

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company
Petaluma, California
Germain Seed Co., Los Angeles, Distributing Agents for So. Cal.

Little Chicks should be fed on **Excelsior Chick Food**

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

Excelsior Cereal Milling Company

242 Central Ave., Los Angeles

Mammoth Bronze Turkeys---S. C. White Leghorns

From our large, vigorous White Leghorns, the largest eggs produced by any Leghorn breeder in the West. $1.50 for 15, $7.00 for 100 and $60 for 1000.

To make room for young stock we must dispose of a large number of this year's breeding birds. They are two years old and the pick of our flock and must be sold at once. Write us your needs. The price is right.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

ALFALFA AS POULTRY FOOD.

FEW people realize the value of alfalfa as food for domestic animals. To a large majority of people it is simply hay and they fail to recognize the fact that there are few products raised on the ranches of California that are so rich in that most important and costly constituent of animal food, protein, as alfalfa. A good sample of wheat bran contains about 12 per cent of protein; a good sample of alfalfa hay may run as high as 14 to 16 per cent protein and the protein of alfalfa is as digestible as that of bran. A pound of protein in bran at the present time costs 14 to 15 cents, while a pound of protein in alfalfa hay can be bought for 5 cents.

A correspondent asks why feed protein matter at all if so much more costly than the other constituents of animal food.

The making of lean meat, the production of milk and eggs are largely dependent on the supply of nitrogenous material in the food. All these substances are rich in nitrogen, consequently the food must contain it in order that they be produced. A dog fed on butter will die of starvation nearly as soon as if fed nothing, because this substance is so low in protein, while horses fed on alfalfa hay without grain will sweat readily and fail to stand up to their work. In each case the ration lacks an important constituent of food, and is more than amply supplied with the others; i.e., the ration is unbalanced. The first feed, the dog lacks protein. The second feed, the horse is low in carbohydrates.

In feeding poultry we get an ample supply of starchy material in barley, wheat, Kaffir corn, etc., and we look to wheat bran, cocoa oil meal, linseed cake and beef scraps substances to supply the protein that is lacking in these grains, but as was previously stated, a pound of protein in bran costs at the present time 14 to 15 cents while it can be bought in alfalfa for 5 cents.

Alfalfa in its green state or when cured as hay is a very satisfactory poultry food, and the use of alfalfa meal is becoming a common practice with poultrymen. Poultry will feed readily on the dry leaves of the alfalfa plant when they have access to it and much of the fine material scattered off from the hay in the hay mow may be used to great advantage in feeding them. As this scattered material is mostly leaves, it is the best part of the plant and can be fed alone or mixed with other feed.

The nitrogenous element of alfalfa is just what is needed for the development of the young fowl as well as for the production of eggs, and a number of so-called poultry foods are said to be composed in part of ground alfalfa. It is best for poultry to use the alfalfa cut before or in early bloom. It is softer in texture, has a larger proportion of leaves, less woody matter, and is more succulent, while poultry of all classes will eat alfafa hay or at least the leaves from it and thrive. It is probably a better practice to chop or grind it and mix it with ground grain or mill products low in protein.

The method is practiced by some of steeping the cut alfalfa hay in hot water and letting it stand for several hours before feeding. If this is done and the grain ration mixed with it, the effect is practically the same as when green alfalfa is fed. Corn meal and ground alfalfa or alfalfa leaves steamed to soften it, makes an ideal balanced ration for the production of eggs.—S. S. T.

CORRECTION.

In the article on Kaffir corn in this department last week the expression occurs: "In interior valleys and on irrigated lands." It should have read on non-irrigated lands. One of the strong points in favor of Kaffir corn is that it can be raised where a crop of Indian corn would fail for lack of water.

It is true that it gives much heavier yields when irrigated, but in such localities Indian corn is usually preferred.—S. S. T.

POULTRY BREVITIES.

Neglect to exterminate lice causes more loss among little turkeys than any other cause and their presence is quite frequently unsuspected.

* * *

Kill lice on the hen turkey before she is set and dust her and the little ones with insect powder three times per week while they are cooped.

* * *

Use carbolized vaseline for greasing the heads of little chicks and turkeys when bothered with head lice.

* * *

Turkeys do best if kept and fed separate from hens and chickens.

* * *

Young Turkeys require food oftener than young chickens.

* * *

Poultry Manure.

I have a small orange orchard and also keep a large flock of hens, and at times have opportunity to buy hen manure for the orchard, but am at a loss to know what I can afford to pay. I have seen statements in poultry papers that as fertilizer, it is worth $5.00 to $20.00 per ton, while I am offered some for $12.00. I have read that poultry manure loses its fertilizing value very rapidly and consequently care must be taken to prevent this. Will the Cultivator tell us what we can afford to pay for hen manure for fertilizer and also the best methods of preventing loss of fertilizing material in the same.—E. H. K., Colton.

Hen manure and poultry manure, in general, are very rich in fertilizing constituents, especially nitrogen, and this plant food is in a very readily available form. Again being so readily available as plant food it is easily lost unless precautions are taken to prevent such losses. We should remember, as in case of other natural manures, that hen manure is very variable in composition, depending on the stage of growth of the fowl, the character of the food and the care taken of the manure.

The nitrogen has been found to vary from 0.7 to 2.8 per cent; the phosphoric acid from 0.5 to 2 per cent and the potash from 0.25 to 0.9 per cent. This snows that such manure well cared for is much richer than that of other animals, but as stated above, it quickly loses nitrogen by fermentation and deteriorates in value if not mixed with absorbants or preservatives. Various methods of preventing this loss have been proposed from time

to time. When the manure is not used fresh it is well to mix it with dry earth or land plaster, gypsum. Sandy material has no value as an absorbant. A common practice is to sprinkle the dropping boards frequently with plaster and in order to put the droppings in good form for distribution on the soil to compost them with loam.

The Maine Experiment Station reported comparative tests of land plaster and acid phosphate singly and combined with sawdust as preservatives of hen manure.

Three nights' droppings of 180 mature hens amounted to about 45 lbs., containing, when fresh, 2.8 per cent nitrogen, 1.8 per cent phosphoric acid and 0.9 per cent potash. This was mixed with the preservatives and stored in barrels from May to November. An examination at the end of that time showed that when the manure was stored by itself or with sawdust more than half the nitrogen had escaped. The lot stored with 40 pounds of plaster lost about one-third of the nitrogen while that stored with 80 pounds of plaster and 15 pounds of sawdust lost none. The lots with acid phosphate both with and without sawdust lost practically none of the nitrogen. This carefully concluded experiment demonstrated that as a preservative for hen manure acid phosphate holds first rank; another advantage of this substance is that in itself it is a valuable fertilizer, carrying large per cent of phosphoric acid. In this connection I may say that acid phosphate is equally valuable for preventing loss of mixture in horse and cow manure. Acid phosphate, sometimes called super-phosphate, may be bought from any of the firms handling fertilizers at 26 to 28 dollars per ton containing 18 to 20 per cent phosphoric acid.

Now a word as to what one can afford to pay for hen manure as a fertilizer.

As previously stated analysis shows nitrogen varying from 0.7 to 2 per cent. An average sample would contain about one per cent of or 20 pounds to the ton at 20 cents per pound for the nitrogen which is about what it costs bought in commercial fertilizers. We have $4.00 for the value of the nitrogen; one per cent for phosphoric acid gives us 20 pounds at 7 cents per pound, giving $1.40 as the value of phosphoric acid in one ton. Ten pounds of potash at 7 cents equals 70 cents for potash; total $6.10 cents as the value of one ton of hen manure of the composition assumed. A very excellent sample carefully preserved might be worth $10.00, but at the present rates for fertilizing material it would not be advisable to pay more than $7.50 per ton on the orchard.—S. S. T.

* * *

Dry Farm Feed.

We are feeding at the present time some 400 hens and chickens, so the question what shall we feed is one of absorbing interest to us. As we are located where irrigation is not possible and intend to raise the most of our chicken feed; we would like your advice as to what we can raise from which well balanced rations can be compounded.—J. W. M., Shandon.

The great difficulty in locations of this kind is to secure sufficient material rich in nitrogen to balance the starchy food that can be easily grown in such situations. Barley, wheat and Kaffir corn are all crops that supply abundance of starchy food. The Kaffir corn will produce a crop with a small amount of moisture as compared with many other crops. The durum wheats are strongly drouth resistant and are also richer in protein than other wheats. A variety of this is known as speltz, but where alfalfa cannot be grown it is seldom possible to get enough protein without buying more or less bran, cocoanut oil, oil cake, beef scrap, etc. Another difficulty in non-irrigated regions is green food during the summer months.

If kale is started early in the spring it will continue to produce for a long time and give a generous supply of green stuff. Pumpkins, roots, etc., will help out where they can be grown.

* * *

Turkey Pasture.

Will you please tell how much alfalfa pasture it will take to raise 100 trukeys if it is fenced in two parts so that one part may be free to grow while they are eating on the other? And, of course, considering that they are to have the needed daily feed of grain.—Mrs. E. N. P.

It is rather hard to say how much alfalfa pasture would be required to feed 100 turkeys. During the early part of the season while they are small only a small patch will be needed, but as they get older they will dispose of a much larger quantity and when six months old their capacity to dispose of alfalfa will be surprising to say the least. I think you will find it advisable to provide two or three acres of good alfalfa divided into three lots. During the early part of the season you will find it necessary to cut this for hay but later on the turkeys will take care of a goodly quantity. An alfalfa field with plenty of shade and good water makes an ideal place to raise turkeys. Under these conditions a pound of turkey meat can be produced at a cost that leaves a respectable profit to the grower, providing the mortality among the young poults is not too great.—S. S. T.

FATTENING TURKEYS.

Of all farm animals, none pays better for the extra flesh that can be put on than the turkey, because it sells for more per pound. A little different treatment is required than for chicks and fowls. Turkeys will not usually do well in close confinement, though some English feeders pen them for fattening. Those to be kept over for breeders should be separated, as well as those not yet old enough for market. The best and most vigorous should be selected for breeding stock, and not the late-hatched that are too small to sell. Feed the fattening birds three times daily (some feed four times) unless they have the run of grain fields where they can play the part of scavengers. The first meal may well consist of cooked potatoes, turnips, beets, squash, pumpkins, sweet apples or other vegetables, and a little beef scrap, the whole thickened with corn meal or corn and oats ground, and bran. Milk is excellent for moistening this mess. Feed this as early in the morning as possible. A little pulverized charcoal two or three times a week is a helpful addition. The other meals of the day should consist of whole corn—old—varied with wheat and a little barley. If absolutely necessary to use new corn, begin moderately with it. Grit or gravel should be handy, and water or milk for drinking. Turkeys which are regularly and heavily fed will not be so active or inclined to roam like those lightly fed, and be more likely to come for their feed. About three weeks is required for fattening properly, so if one begins in late October, he should have his turkeys ready for the Thanksgiving market, as prices for choice turkey are highest at that time. Medium-sized turkeys are most in demand, large sizes being desired by few.—Farming.

MOVED.

The Pioneer Hatchery Company is moving into its own building at 108-110 and 112 East Eighth street, where it will have one of the largest hatcheries of its kind. The old location at 711 South Main street, was entirely too small, and the new quarters will give ample room for this firm's rapidly growing business. They would like to hear from any one that has thoroughbred eggs to sell in large quantities of any variety.

A COMPLIMENTARY EDITORIAL.

It is generally true that an external remedy that is good for an animal is also good for the human body, and Gombault's Caustic Balsam is no exception to this rule. In fact, we sincerely believe that there is no liniment or external remedy on the market that is as good or as safe and reliable to apply to the human body as Caustic Balsam. We can safely recommend it in all cases where an external application could benefit. It is also cheaper according to cost because it requires very little, and that little is effective—["Horse Review," Chicago.

Sacramento valley wil make an extended exhibit at the Scattle exposition.

FEED YOUR PULLETS

As well as your Laying Hens, on

Coulson's Egg Food

It will bring them to maturity in health and vigor and ensure you lots of eggs in the Fall when prices are high. It can be fed moistened as a mash, or dry in hoppers. Manufactured only by

The Ornamental Garden

CALIFORNIA GARDENS.

AS CALIFORNIA has evolved from many styles the beginning of an architecture wholly suited to place, climate and people, so is she slowly recognizing her needs along the lines of architecture and sculpture in her flower gardens, writes Gussie Packard Du Bois in the Los Angeles Times. Here, as in building, adaptation and creation must work together.

This article is intended to give a few suggestions as to ways in which people of other countries have handled architectural accessories to flower and shrub. For while mere mimicry can only be absurd, the principles of true art are everywhere adaptable.

This has aptly been called "The Little Italy," but the Italian garden architecture will not bear transportation here as an entirety, but the pergola has been assimilated and is already naturalized, as other elements have been absorbed in other countries.

Four things are essential in the purely Italian style. First, there must be a sloping site, terraced from successive levels so that a constantly changing outlook of scenery is the result. Then the vistas provided by walks and avenues are frequently broken by buildings, fountaings, statuary, or long lines of steps, thus creating varied contrasts. A third item is that of the distinctly architectural effects of all these structures, and the fourth is that of fountains and cascades.

Obviously, here in California, where water is of such intrinsic value that the mere touch of its fingers, Midas-like upon the desert soil, is sufficient to make it blossom like the rose, there can be no waste of it in fountains. Then after one has lived for a time in California any large display of running water seems to be out of harmony with the general scheme. Small fountains that drip and splash into pools of aquatic plants, little streams that run shallow over rocks and into basins where lurk gold fish and other finny denizens, these seem wholly in keeping, but not the great leaping fountains aud long tiers of cascades that form a part of every formal garden of sunny Italy.

California Reproductions.

It would be absurd for us to attempt to reproduce here in Califoruia the exact copy of any of these methods of garden architecture, but, at the same time, it is wise to adapt to our use such methods as lend themselves readily to the prevailiug couditions. Genius lies in making use of the material at hand, and so profitiug by the experience of others as to make the best use of it.

Many elements are lacking here that are available elsewhere, but the reverse is equally true.

There is a weirdly decorative effect in the long lines of eucalyptus trees on the road, their shining bare white truuks stauding almost as imposiug in appearance as the rows of statuary or urns in an Italian garden, or of stone lanterns in a Japanese.

Our palm avenues, especially of the old trees, are truly oriental. Paul de Longpre's grounds in Hollywood, The Outpost, and others are well worthy of note.

Westlake Park, Los Angeles, has many fine effects, notably that of the desert, to be seen in the cactus snarl. Busch's sunken garden in Pasadena is an excellent example of the use of the material at hand, even unsightly surroundings, to create a thing of surpassing beauty.

On California street in Pasadena is a plot of ground that makes so perfect a setting for the house as to give the impression of a finished picture. The structure is a very long, low bungalow, with many casement windows. It is surrounded with a perfect tangle of California poppies, with a few of the cultivated variety, the true poppies, mixed in. There are roses along the walk, but the effect is that of a house and a field of poppies both growing wild from self-sown seed.

Great Possibiilities.

The possibilities of garden growth are almost miraculous in California. There are many poppy fields, but it was left for one to build a house that seemed to grow naturally with these cups of gold. There are hundreds of thousands of eucalyptus trees, but only here and there are avenues of naked trunks, or a single citrodora, as picturesque in a California landscape as is a stone pine in an Italian one.

Italy is poor now; many of her old gardens have fallen into decay; others have been rejunevated by wealthy Americans. On the contrary, California, the golden State, is rich. Wealth sooner or later commands beautiful surroundings, and whoever makes of his grounds a beautiful picture hastens the time when this shall be true of us as a State.

The long aisles of a lemon or orange orchard, the regular exactitude of a well set vineyard, these in themselves are beautiful, and already many growers have enhanced their effectiveness by imposing and artistic gateways, diagonal avenues of palms, good architectural schemes in necessary offices and buildings set with an eye to mountain and valley in the distance.

IRIS.

Irises are of three classes: The first is the bulbous, which is very much like tulips and about same size. These are called the English and Spanish. They have been grown in the west for some years but have been discarded. They are not robust and hardy enough. We want something that can take care of themselves. Another class belongs to the Rhizotomous family because the roots are rhizomes. They add bulb to bulb somethiug like potatoes uutil they increase rapidly. This comprises the large German family. Then there are the tufted varieties which also multiply rapidly and every two years at least the roots must be pulled apart.—Denver Field and Farm.

Lilies have various methods of increasing. All of them reproduce themselves by divisions of the main bulb as it grows older, which is also the case with tulips. The outside scales of the bulbs are also used to increase the stock of rare varieties. These scales when planted in flats or sandy soil form bulblets on the lower end but are left in the flats until the secoud season. Some varieties of lilies like the Elegans, Auratum and Speciosum when planted deeply in light soils form bulblets along the stem under ground. Many of them mature into bulbs if not damaged otherwise or they may be takeu up and grown for a season in flats or seed bed. The tiger lilies, as is well known, produce their bulblets in the leaf axil and these should be planted as soon as mature. It requires two or t hree bulblets to come to the blooming size. —Field aud Farm.

Small Fruits and Vegetables

THE CARE OF TOOLS.

I HAVE seen so many people trying to work with rusty tools that I want to emphasize the fact that the ease of handling and the perfection of work done by bright tools more than repays the slight attention necessary to keep them bright. A new tool is quite bright—keep it so! If the other tools are rusty, scrape and grind them or polish with emery. Of course the soil will grind the rust off the hoe when it is used; but this polish will extend but an inch or more up the blade and the labor consumed in doing this polishing should have been expended in pulverizing the soil. The entire blade of a hoe and all tools used for working the soil should have a bright polish. The soil sticks to the rusty portion of the blade, preventing the proper working of the tool, and, moreover, the soil in falling off is thrown over the plants, smothering the small ones.

If the parts of a wheel hoe are rusty, the soil piles up on the hoes or cultivator teeth instead of sliding over them, and falling on small plants, smothers them. That is the explanation of the complaint that the wheel hoe could not be used for small plants. With bright tools and short strokes it will do the work properly.

When through with a tool wipe the blade of the hoe or tines of the fork dry, oil, and put away under cover. Any heavy oil, tallow or cosmoline will do for this purpose, provided it does not have salt in it. A convenient way is to put a small quantity in a tin box (a baking powder tin will do,) place a brush or piece of waste in the box and keep it at hand in the tool house, and use it every time that a tool is put away. Every gardener ought to have a tool house or closet devoted only to the tools.

All metal parts that do not come in contact with soil need a coat of good paint—this refers to shanks, ferrules, rake and fork heads, etc. The paint will prevent rusting and save time in cleaning.

The handles need attention as well as the blades. Give a coat of linseed oil about once a year. Allow this to dry in before the tool is used. This treatment will make the handles moisture proof, they will wear smooth, and will not splinter.

Cutting tools need sharpening; they work better and easier then. This applies especially to hoes which are sharpened on the underside or back of the blade with a rounding bevel. The wear comes on this side, and tools sharpened this way will keep in good condition with very little attention. Do not give a straight bevel as to a chisel, for the fine edge thus produced soon dulls, and, moreover, the tool will not work any easier in the first place.

IRRIGATING THE POTATO FIELD.

Regarding the details of irrigating the potato field, the manner of laying out the rows, there are a few simple points which are essential to the successful raising of a potato crop. First, you should not irrigate potatoes up if it can possibly be avoided. Wetting the land at this time is very likely to bring on attacks of disease which will result in a poor stand and serious injury to the plants throughout the growing season.

Ordinarily the first irrigation should not be given until the tubers are set. If the tubers have a chance to form in a comparatively dry soil, the majority of them will be formed at one time; then when water is applied all will have an equal chance to develop; the result should be a crop of even sized potatoes. The water should always run shallow in the furrows, never deep enough to stand around the tubers, but a sufficient amount applied so that the moisture may seep up into the ridges.

In this way the soil about the growing tubers may be kept damp but not soggy. This is the ideal condition for the potato plant but unfavorable for the growth of potato diseases. An effort should be made to keep the soil moisture uniform by frequent light irrigations. If the ground is allowed to become dry, the growth of the tubers is checked; then when water is again applied, a second growth starts in, which results in knobs and irregular growth. The tubers of some varieties crack badly under this treatment.

It is essential that the potatoes should mature in comparatively dry soil. If the soil is kept wet until harvest time, the tubers contain an excess of moisture and this necessarily results in poor quality. Then, too, potatoes dug when the soil is wet present a poor appearance on the market, because of the quantity of soil which is bound to stick to them. In order to have the soil in proper condition at digging time, and the potatoes of the best quality, it is necessary to stop irrigation three or four weeks before the usual time for frost.—Western Farmer.

POTASH FOR POTATOES.

A safe and effective dressing of muriate of potash for potatoes is 250 pounds to the acre. Wood ashes sown evenly, broadcast, at the rate of one ton to the acre, is also an excellent and safe fertilizer.

Do Irrigation Work--Quicker and Easier

For Leveling Fields—For Cutting and Clearing Laterals

The photo is from an actual field-scene in New Mexico, where a 20th Century Grader is leveling seed-beds on the great truck-farm of Herman Blueher. He says: "Your 20th Century Grader has no equal for land-leveling, seed-bed making, ditching and for all kinds of irrigation work. I have reduced my force one-third since buying this machine." The

20th Century Grader

weighs only 600 lbs—light and handy—and is easily handled by one man and two horses. It is all steel and malleable iron. Price very reasonable. It pays for itself in one season. If your dealer hasn't it ask for name of nearest agent. Write now for new free booklet with large cuts showing every part.

General Manufacturing STOCKTON, CAL.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Rostrata and Jarrah.

You recommend E. Rostrata or red gum for the Imperial Valley. What variety of eucalypti is best for us here in the San Joaquin Valley? Have been experimenting with the famous "Jarrah" of Australia. It propagates well but soon dies here at Fresno.—J. V., Fresno.

We think without question you will get good results from Rostrata in the San Joaquin Valley. It is fully as drouth resistant and more resistant to frost than the blue gum. The blue gum grows a little more rapidly than the red. We thank you for your report on the Jarrah, Eucalyptus marginata, which is in line with all the reports so far as we have heard in this State.

Up to Date Machinery.

A subscriber at San Bernardino and others have written the Cultivator asking for information as to steam power and up to date machinery in doing ranch work.

Other than the ordinary traction engines, usually of steam power, though more recently the gasoline engine has been used in traction power, we know of no generally practised method of power on the farm. Cultivation has been done by the cable system, but we do not believe it has been practised to any great extent in California.

Insect on Grape Leaf.

A subscriber whose address is lost sent the office a grape leaf which was being destroyed by a small beetle. This was forwarded to Prof. Quayle and he writes:

The insect on the grape leaf is a beetle, which may do the injury indicated, but I have no previous record of such an insect doing any such important injury. It may, of course, be killed with lead arsenate or paris green. If you can give me the location of the vines where this leaf was taken, I may be able to have an opportunity of looking into the matter in the field.

Packing Grapes.

I would like to ask a question regarding your cluster packing. How many pounds do you put in the baskets? Do you ever use more than one layer? What is your opinion about using tarleton?—K. C., Lodi.

In regard to the bunches of grapes in packing clusters, only those are used that are of such a size that two, three or four fill the large basket. This holds from ten to twelve or even more pounds, according to how high it is cleated in the crate. The points of the bunches lie under the shoulders of each other, or sometimes two are placed with stems at opposite ends of the crate and one or two smaller bunches are cunningly worked under and between them by lifting up their sides. It is all in the packer's idea of spacing them so that the stems will appear scattering and the ribbons be far enough apart to look well. We never pack more than one layer of fruit in cluster work in a basket. The old style two-tiered crates may exist somewhere but I have not seen one in use here for some years. Tarleton is rather an improvement in holding a package in shape at the other end of the line. It keeps the grapes from working out and hanging loose to be crushed between the crates. This is mussy looking and may also set up moulding if a car is at all delayed. The first use of the tarleton was intended to keep the men from handling the grapes, after the carloads were broken up into express packages. The grapes were torn and the bunches marred by pilfering fingers. The trade did not like to have the packages come in not full. It seems a pity we cannot ship some cheap fruit to these men that long for it. The fruit they take is far beyond their means to use.—M. E. S.

Sex of Eggs.

Please inform me through the query column if there is any way of distinguishing which eggs will produce only pullets. I have tried the air cell system which does not give satisfaction.—C. A., Napa.

The failure of your test of the air cell system is only in line with every effort that has ever been made to determine the sex of the chick which will come from the egg. Theories have been advanced that the slim, longer egg produced the male, while the shorter round egg produced pullets. But the most scientific tests have failed absolutely in producing any way of telling.

Exterminating Flies.

Please tell me through the queries as to whether lime scattered on manure will injure its fertilizing qualities? If so, what can I use to keep the flies away?—H. G., Bloomington.

Use of lime on manure injures only in that it aids in escape of ammonia which contains the nitrogen, and thus causes something of a loss in the most expensive element contained in the fertilizer. However, as between the two we would use the lime, and freely, although we may say that the best way both for economy in handling manure and for hygienic reasons, is to keep the manure cleaned up and scattered in the fields. Then with the sun drying the moisture from it there is no opportunity for flies to use it for breeding their young. In this line it is perhaps in order that we should quote from a bulletin issued by the United States Department of Agriculture on this subject.

It is unpardonable carelessness, it is almost criminal negligence to permit this pernicious pest in our homes.

Its suppression is a matter of difficulty.

Screened windows and doors, and the use of sticky fly paper avail much, but the most certain method of reducing the number of house flies is to attend to their breeding places.

Manure heaps should be so covered that flies are deprived of a breeding place. Stable droppings should be immediately cares for. They ought to be sprinkled with one ounce of white arsenic in a gallon of water, or with a little kerosene or chloride of lime, or still better they could be placed in a fly-proof box. Outhouses should be made fly-proof and the pest can be kept down in numbers. An isolated farmer troubled with the pest has but himself to blame. A community needs concerted action from all its members, and a material reduction of house flies can be assuredly promised.

House flies breed in fresh horse manure, human excrement and nowhere else.

They scatter filth and spread disease wherever they alight.

House flies are capable of multiplying into the millions in a month.

The flies parading over food and dishes have every one of them just come from a bed of filthy excrement.

Flies are made so that they have to "spit" first on everything they eat before they can swallow it.

"Flyspecks" are twice voided excrement, first by the horse, then by the fly. Should we tolerate them?

House flies are responsible for more typhoid fever than bad drinking water is.

And lastly, house flies can easily, simply and effectively be checked.

Turkestan Alfalfa.

Kindly inform me whether Turkestan alfalfa, alfilaria and Wonder Plant will grow well in Imperial Valley, and if they will pay better than alfalfa.—Subscriber, Chicago.

We think you will find alfalfa more profitable than the plants you mention, though the one which you call Wonder Plant we do not know by that name in this State.

Alfilaria is a native annual in this State and grows in many sections where the rainfall is sufficient. We do not believe it has been cultivated to any great extent and we are quite sure the rainfall of Imperial Valley would not be sufficient to mature a crop of it. And if it is to be irrigated it would in no sense equal alfalfa.

Turkestan alfalfa (Medicago sativa var. Turkestanica) has been tested in many parts of the United States and has been found, in a few sections of the more arid northwest where irrigation is not followed, to be much hardier than the ordinary alfalfa. It has been proved to resist a much lower temperature and also to be much more drouth resistant. It was introduced from Central Asia many years ago and in 1900 the Department issued a bulletin upon it which will give you more particular information. At the Pomona station the 1900 report states that it was tested on both alkali and arid sand soil. In both these localities it proved superior in drouth resistance to the common variety. At the Paso Robles substation of this state, where the total rainfall of the season in which the report was made was only five inches and the soil shallow and very poor, only two forage plants remained green during the summer. One of these was the Turkestan and the other the Australian saltbush. We doubt, however, either of these living through the summer season in the Imperial Valley without irrigation. In case you can irrigate we would strongly advise the ordinary alfalfa.

Sweet Corn.

Is it too late to plant sweet corn for roasting ears or to plant beans for string beans? Will carrots and parsnips do well planted now? Is it too late to set out sweet potatoes? What kind of shade trees can I set out now that will start to grow at once?—Subscriber, Hemet.

No. Sweet corn may be planted as late as middle of August and enable you to secure roasting ears—unless you are located where very early frosts occur. The same answer applies to string beans. Neither carrots nor parsnips would likely germinate for you during the summer under ordinary conditions. They start very slowly and need cooler weather like February and March to start. It is doubtful if you could mature a crop of sweet potatoes planted so late as this. You can set out any kind of shade tree now that you can buy at the nurseries that are grown in pots. Of course it would not be possible to take up trees from open ground that are in active growth and transplant them successfully unless with a great ball of earth—which would make them expensive. From December to April is the best time to set out shade trees.—Q. A. L.

Blackberry.

Will you kindly inform us through the columns of your paper as to the care of blackberry bushes, as to training, pruning, irrigating, etc.? Do they need irrigating now that they are through bearing? We would also like information on the culture of cauliflower and of sunflowers.—F. S. E., Glendale.

The pruning and irrigation of blackberries from this time until the close of the season will depend upon what you wish the plants to do for you. If you would like some fruit throughout the season, it will be necessary to irrigate enough to keep them in active growth and shorten back the main stalks to 2½ to 3 feet and the side branches to 12 or 15 inches. This treatment usually forces a partial crop the latter part of the season. This is especially true of Crandall's Early. Scant irrigation and no pruning will leave you wood that will bear next season and it should be thinned out to 3 to 5 canes to the hill and shortened back as recommended for summer pruning, any time during January. At that time also the canes that have previously borne fruit should be cut out.

The culture of cauliflower is very similar to cabbage but a little more exacting in its requirements. It is folly in California to sow the seed earlier than July, unless it should be adjacent to the seas, for the intense heat we usually have for a few hours each day in September and even October is almost always sure to destroy any that is sufficiently advanced to form heads. Plant the seed from July to March. Make the ground very rich and never allow the plants to suffer for water from start to finish. Be sure you get good seed.

The culture of sunflowers is of the simplest kind. Plant the seed in rows very much as you would plant corn—cultivating and irrigating just as you would corn. Thin out so that a good plant will stand about every 10 or 12 inches in the row. Plant any time from middle of March until May 1st. It will be much easier to produce the crop than to preserve it—from the birds.—Q. A. L.

Red Scale.

A subscriber from Selma sends leaves from an orange tree on which are a number of insects he wishes identified.

These are nothing more nor less than the dreaded red scale, the only satisfactory remedy for which is a thorough fumigation with hydrocyanic gas.

Twig Borer.

E. B. P., Helix, San Diego county, sent a twig which was forwarded to Prof. Quayle, and he writes:

I am unable to say positively just what the trouble is. I am suspecting that it is the peach twig borer, but the sample has been broken off too

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

short to determine this positively. This is an insect which bores in at the base of the leaves near the tips of the twig, killing the part above the place of puncture. There is apparently also a little evidence of curl leaf on one of the leaves, but the grower is no doubt familiar with this trouble and would have selected a better sample.

Frog Raising.

Will you inform me through the Cultivator as to where I can secure information on how to raise frogs for market? —B. C., Winters, Yolo county.

We do not know where you can secure information, although we are told that Miss Elizabeth Stege of Stege, Contra Costa county, has the largest frog producing farm in the United States. She markets from thirty to thirty-five thousand frog legs a year and we understand makes reasonable profits.

Best Separator.

Will you please tell me what you think is the very best separator? I want to get one and am not able to experiment with several.—S. W. T., Loomis, Placer county.

There is no best separator. The one best to buy is one that has a good agency closest at hand. Supplies and repairs will then be readily obtained. I have used two De Lavels, two Sharples, one Empire, one U. S. and I do not care greatly which make the next one purchased will be, for when operated according to directions all did good work. I have recently seen in Southern California one of those sent by the mail order houses. It was flimsy and after only a short time in use had been soldered again and again. I would not buy a light weight machine, for the speed at which they are driven or turned is high enough to make them self destructive if not made of good stuff. The difference then of the standard makes is like that of sewing machines and pianos—many are good and will do their work well.—M. E. S.

Cutting Alfalfa.

When is alfalfa ready to cut to make the best hay?—Subscriber, Stanislaus county.

Formerly we were told that when alfalfa was in full bloom it was ready to cut. But more recently it has been determined that the farmer who cuts his alfalfa when coming into bloom will secure practically as much hay at each cutting, possibly secure an extra cutting during the season, and in addition secure the very highest quality of hay. We hope to answer this question more at length later, and in the meantime, we ask our hay making subscribers for their experience.

Aphis-Weevil.

What is the best remedy for black aphis affecting cucumber and squash vines? Also what is the cause of the little brown bug that infests shell beans during the winter and what is the remedy or preventive?

A weak solution of kerosene emulsion is sufficient to rid your vines of the aphis, or at least to kill most of those which are now infesting the vines. But reproduction is so exceedingly rapid that you will doubtless have another group come back very quickly. Even spraying with water from the garden hose, if of strong pressure, will usually take them off the vines. Best remedy is to have a change in the weather which will probably give you immediate relief. The little brown bug we imagine is nothing more nor less than the bean weevil. The remedy is carbon bisulphide, which must be confined in a tight room with the beans for several hours.

General Agriculture

GOOD ROADS.

HOW fortunate we ought to feel, as a people, that the highway improvement proposition is taking direct form in California. We have waited so long for this much felt want that many of us had almost despaired of living a sufficient number of years to realize the fulfillment of our hopes.

The University of California may properly be credited with being the pioneer in this good cause, for the subject of good roads has occupied an important plan in its institute work for several years. Closelly allied with the University idea, have been the agricultural newspapers of the State, which, unreservedly, have advocated a better system of road building from the farmers' point of view.

But it matters little where the idea first found promulgation, it is enough to know that all over the State people are endorsing the movement, and that from Stockton to San Diego, good roads societies are being organized,

HARVESTING.

with the single idea of pushing the highway improvement project to a complete and successful ending.

In Los Angeles county the sum of $3,500,000 is to be voted upon today to build 307 miles of macadam road in the county of Los Angeles.

At a recent convention, held at Stockton, I am informed the Governor urged the adoption of a resolution asking the incoming legislature to appropriate $18,000,000 to aid the highway commission in building a vast and complete system of good roads in this State. Stockton is already at work on a plan to improve several hundred miles of roads.

The spirit of highway building for the Pacific Coast is here; it is reaching into Oregon and Washington, not to the same extent, nor with the same enthusiasm, as in California, but it is moving, and soon will be widely extended and all pervading.

Now, to collate a long argument for improved highways into a brief but concrete one, let me make these points:

Good roads are elements of growth; the best proof of intelligence; they build up a community and enlarge social and religious advantages; they add to the value of property and bring farmers nearer to market; they save wear and tear of horses, harness and vehicles; they save time, labor and money; they open the avenues of commerce and distribute the products of our industries; they are the property of the common people, rich and poor alike; they belong to all, benefit all alike, and all should contribute to and support them—especially the farmer, who derives the most direct benefit therefrom.—J. J. Steadman, Hollywood.

Congressman Needham has been in Pajaro valley investigating methods of apple shipping and the needs of apple growers.

SOIL CULTURE MANUAL.

"The proper fitting of the soil for the conservation and control of moisture and the development of soil fertility; how moisture moves in the soil by capillary attraction, percolation and evaporation; the relation of water and air to plant growth, and how this may be regulated by cultivation."

The above quotation is from the title page of Campbell's 1907 Soil Culture Manual, by H. W. Campbell, Lincoln, Nebraska. It is a book of 320 pages divided into forty-five chapters and with a valuable index. It is illustrated throughout with drawings and halftone engravings. Its price is $2.50, which at first look at the book seems rather high, but doubtless tne contents is of such a nature that it was an expensive book to compile In any case it contains much of value to the soil culturist. In his introduction Mr. Campbell says:

"The reader will not find in the pages of this Soil Culture Manual a universal guide to success in farming. But he will find something here that will be of immense value to him if he but has the patience and industry to master the principles and is willing to give a fair trial to the methods which are here described for the treatment of soils. It is presented with a confidence born of years of investigation and experiment, and of success in many seasons of adverse conditions spread out over many States with soil and climate as different as it is possible to have.

"This Soil Culture Manual has to do with just one subject, or rather one branch of agriculture, but it so happens that this lies at the very foundation of all agriculture. Production is the end and aim of all farming. Production is possible only where soil conditions are right, for no matter what may be the climate or the extent of cultivation, there cannot be crops if there is no fertility available in the soil. Available fertility may exist, under most favored conditions, where there has been no cultivation; but it is more often true that fertility comes from conditions brought about by cultivation done intelligently."

"It is not intended that this Soil Culture Manual shall contain any simple code of imperative rules to govern every act of the farmer in his culture of the soil. The nature of the subject forbids this. What must be done is to give the inquirer a clear statement of general principles, with simple directions for applying the same under many varied conditions, and to explain the reason for doing certain things then to leave it to the intelligent direction of the farmer to do the rest. These general principles relate to soil physics, to the character of the soil, the texture of the soil, the movement of moisture in tne soil, the development of soil fertility or those elements essential to plant growth, and what can be done and must be done by cultivation to affect the quantity and quality of the crop. One who comprehends clearly these principles and labors with the knowledge that is in him, will find the way to profitable agriculture."

SEED.

FOR SALE—EUCALYPTUS RUDIS SEED, fresh, by pound or ounce. MINNEWAWA VINEYARD, Fresno, Cal.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

MACHINERY.

FOR SALE—ONE NO. 8 CENTRIFUGAL pump (vertical,) good as new, with all fittings; very cheap. We have an all steel frame traction running gear without power, very cheap. One 20-H. P. firebox boiler and 15-H. P. engine, all mounted and in fine shape, ready to go to work. Come and see it. One 6-H. P. gas engine, all in fine shape, good as new, for $75. A. CANNADY & CO., 1029 N. Alameda St., Los Angeles, Cal.

CLOSING OUT GASOLINE ENGINES NEW and secondhand standard makes 5 to 60-H. P. See us before buying. Can save you money. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles.

BRAND NEW—DISTILLATE ENGINES 10-H. P., $250; 20-H. P., $400; 30-H. P., $500; 40-H. P., $700; 60-H. P., $900. Best in the world for pumping plants. See ad page 120 COWHAM SMITH CO.

FOR SALE—AT HALF ACTUAL VALUE No. 7 U. S. Cream Separator, good as new. One No. 9 machine new, to close out. K. B. Norswing, 5833 S. Main St., Los Angeles.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FOR SALE CHEAP—LIKE NEW—25-H. P. Peerless distillate engine; also centrifugal pump. N. W. cor MAIN and BRUNO STS., Los Angeles.

FOR SALE—ADDISON DEEP WELL PUMP head and cylinder cheap. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles.

FOR SALE—3-H. P. ALTERNATING CURrent motor in good running order. Will sell cheap. 117 BRUNO ST. Los Angeles.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

FOR SALE—A BARGAIN—20 ACRES ALfalfa; 2 wells; 12-H. P. pumping plant; 9-roomed house, barn, furnished complete, with cows, pigs and farming tools; family orchard; ¾ mile from town of San Jacinto. Address L. BOX 37 or 'phone 676 Home.

EGGS FOR HATCHING.

ORPINGTONS, BUFF AND BLACK, THE winners of the lion's share of honors at the Los Angeles County and Breeders' shows this year. The birds that win in the keenest competition and lay eggs all the year. Birds that pay as they go. Handsome catalogue free. Guaranteed fertile eggs in any quantity. Proven breeding stock very reasonable. Write today. Orpington Reservation. ROSS & TATE, Altadena, Cal.

EGGS FROM MY PRIZE WINNING BARred Rocks; won all firsts, all seconds but one, and all specials on Barred Rocks at L. A. C. P. A. Show, 1907. Eggs from best pens, $3 per 15; $12.50 per 100. Stock for sale. CHAS. E. SMITH, Gardena, Cal. San Pedro Interurban car to Smith's Crossing.

POULTRY

BUFF ORPINGTONS—WOULD YOU LIKE the very best at the price of common stock? Sullivan's COMMONWEALTH STRAIN you may have at HALF PRICE FOR THE BALANCE OF THE SEASON. Write us and learn the reason; get record and illustrated catalogue FREE.—MR. & MRS. W. S. SULLIVAN, Agnew, Santa Clara Co., Cal.

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. Regular 10c can free, postage paid, for 10 addresses of poultry keepers. WEST COAST MILL, 705 Griffin Ave., Los Angeles Cal.

FOR SALE—STOCK AND EGGS OF THE following standard bred poultry: Black and White Orpingtons, Brown and White Leghorns. J. J. Verkouteren, Route 3, Hanford, California.

PARTRIDGE WYANDOTTES—C. ANdrews, 823 W. Franklin Ave., Hollywood, Cal.—1st cock, hen, cockerel and pullet; 2 cups, Poultry Breeders' Show, 1908.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

CATTLE.

FOR SALE—TWO YOUNG JERSEY BULLS—For particulars address DR. C. S. LANE, Santa Barbara, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

FOR SALE—COCKER SPANIEL PUPS, 8 weeks old; blacks, $10 each. MINNEWAWA VINEYARD, Fresno, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

A GLASS OF BUTTERMILK.

When the day is almost over and you've waded through the clover.
And have left the plow a-sleeping out beneath a spreading tree;
When the meadow land looks dreary and your head and legs are weary
From the toil that makes a living in this world's eternity.
Then a cool, fine glass inviting,
That you wouldn't think of slighting
And if choice is left to merit, then, it's buttermilk for me.

What a treat to reach the dairy with its incense sweet and airy,
Like a store house steeped in treasures just as precious as can be,
And to just sit back and ponder on the clover sweets out yonder
That have helped to make a beverage that brings us ecstasy.
Rich with stores of health and honey
From a realm of blue grass sunny
And if some may want their nectar, it is buttermilk for me.

Comrade cows are idly grazing where the summer clouds are raising
With a swallow darting homeward in the sunset from the sea,
Ah! this dear, sweet life 'o Farming, all a fellow's fears disarming;
It is better than the glory of the city charms that be.
So pour out the drink that's dandy,'
Have another portion handy;
And if some may call for nectar, then, it's buttermilk for me.

—W. Livingston Larned.

A PAYMASTER'S FLIGHT.

WHEN I was a sergeant in the ——th United States cavalry in the far west I was detailed one day to command eight men acting as a guard to Major B., who had paid off the force at our post and was going to pay those at the next. He was a small, baldheaded, lean man, except a round stomach, which begins to protrude upon some people after they pass 40, with a crafty eye and a silent tongue. The only words he spoke were directions as to handling his safe, a small affair that could easily be lifted by two men and for which a place was arranged on a buckboard wagon which the major always used to transport the treasure. His clerk drove the horse, while the paymaster sat beside him, the safe between his legs.

The country through which we escorted the paymaster contained a wild and lawless people. I thought at the time that eight men, though drilled soldiers and well armed, were a small guard for such a purpose. Whether the major thought so or not I didn't know at the time, for he said nothing about it. I learned afterward that the colonel commanding wouldn't give him any more, and the paymaster entered on the trip under protest.

We were crossing a part of what is called the Great American desert, or alkali plains, with nothing there higher than a man's waist. I rode a couple of hundred yards in advance, keeping a sharp lookout in every direction. For more than half a day not a living thing except the members of our party and gophers was in sight. But suddenly in turning to look to our right and rear I saw on a rise far in the distance a mounted figure looking at us. I judged from the general outline of horse and man that he was an Indian. After what appeared to be a careful survey of us he disappeared on the other side of the rise.

I felt a bit uneasy. Turning, I directed each man to see that his arms and ammunition were in order and notified the paymaster of what I had seen. It didn't seem to trouble him much. We jogged on for a few miles and when emerging from low ground suddenly heard a mingling of yells and saw on our right a motley crew several times as large as our own coming down on us. They were evidently a mixture of road agents and cowboys, with a sprinkling of Indians. Their leader rode in advance, a revolver in each hand, the only one of the lot who was not yelling.

I had just time to draw my men up in line between the oncomers and the buckboard before they came within close range, and I told each man to pick one in front of him as nearly as he could estimate. My men were armed with repeating rifles, while the attacking party had some guns, but mostly revolvers. I waited till they came within 200 yards before I gave the order to fire. Nearly every one of my troopers brought down his man. The gang hesitated, and I gave the second order to fire. This halted them; but, rallied by their leader, they came on, bringing us within range of their revolvers, and my men began to get hurt. For some minutes there was a continuous firing on both sides, several of my men being put out of the fight, though but one was killed. My effective force was reduced to four men besides myself, Major B. and his clerk. It began to look as though the robbers were going to get the safe.

> Be honest, but hate no one; overturn a man's wrongdoing, but do not overturn him unless it must be done in overturning the wrong. Stand with anybody that stands right and part with him when he goes wrong."
> —Abraham Lincoln.

Suddenly I was astonished to see Major B., who had stood in the buckboard using a rifle, jump down from the wagon, cut the traces, spring on the horse's back and away he went like an arrow. The act demoralized my force so that they broke. I failed to rally them, and we were all soon tumbling after the paymaster. His clerk mounted the horse of the man who had been killed and joined in the flight.

Never have I been so incensed in my life. The paymaster, a commissioned officer, by his cowardly act had cast discredit on me and my men. I had the mortification to see the bandits ride down on the safe and caper joyfully about it. All I could do was to help the wounded men of my command along, supporting them by turn in their saddles.

But what surprised me was the fleetness of the major's horse. I am no judge of horseflesh, and I had mistaken the animal that drew the buckboard for a mere beast of burden. Looking ahead I could see the paymaster miles in advance, fleeing as for dear life, and in time he disappaered altogether. For once in my life I placed money before human life and wished he were in the safe and the funds were on his horse. I thought with some satisfaction how I would prefer charges of cowardice against him as soon as we reached the post we were making for.

The bandits, having secured the safe, paid no further attention to us, and we rode on to our destination. What was my astonishment on riding into the garrison to see Major B. sitting coolly smoking before an extemporized desk with heaps of bills before him paying off the enlisted men. His belly was gone. It was plain that he had taken it off and placed it—a heap of money— on the desk.

"Thanks, sergeant," he said, "for your fine defense. I have reported you for gallantry, and you'll hear from it. The robbers got a safe with nothing in it. I'd rather rely any time on that mare of mine than a safe. Sorry any of your men got hurt. Next!" And, having paid off the man before him, he devoted himself to the next in line.—Spokesman Review.

HIS RECORD.

"So you wish to marry my daughter. What assurance can you give me that you have the ability to support her? I know very little about you. What have you ever done to show that you possess any business ability—stick-to-itiveness?"

"Do you remember Hibbard & Denton, the tailors?"

"Yes."

"I worked for them once."

"What of that? They failed. You did not seem to possess enough ability to keep them from going to the wall."

"I had no opportunity to do anything in the line of managing their affairs. I merely did collecting for them. In fact, I am the young man who succeeded in getting you to pay a bill of $65 which you had owed for four years and which seven other collectors had failed to get, although they had been after you for—"

"Ah, um—by the way, when did you and Lucy think of having the wedding?"—Chicago Record-Herald.

NO MISTAKE.

A New York produce commission house which prides itself on filling all orders correctly received a letter from a New Jersey customer recently, saying:

"Gentlemen:

"This is the first time we ever knew you to make a mistake in our order. You are well aware that we buy the very best country eggs. The last you sent are too poor for our trade. What shall we do with them?"

The fair fame of the house for never making an error seemed to be at stake, but the bright mind of the junior partner found a way out of it. He wrote:

"Gentlemen:

"We are sorry to hear that our last shipment did not suit you. This was, however, no mistake on our part. We have looked up your original order and find that it reads as follows: 'Rush 50 crates eggs. We want them bad.'

"Henry H. Day."

NEARER TO IT.

Two Irishmen were digging an irrigation ditch the other day. One of them was a big, strong man about six feet four inches in height, and the other one was a little, puny fellow about four feet six inches. The foreman came along to see how the work was progressing, and noticed that one of them was doing more work than the other. "Look here," he cried, "how is it that little Dennis Dugan, who is only half your size, is doing nearly twice as much work as you, Patrick?" Glancing down at his partner, Pat replied: "And why shouldn't he? Ain't he nearer to it?"

IN THE WOODS.

'Tis sweet to worship God when Love commands
In temples unadorned by human hands—
The grand cathedrals of the solemn woods,
Where no unworthy devotee intrudes;
At mossy altars and in cloister bowers,
Where prayer is blended with the balm of flowers;
In leafy coridors and woodland ways,
Where all is resonant with hymns of praise;
In shady groves festooned by drooping vines,
Where bending bough with pendant branch entwines;
Where babbling brooks with liquid tongues proclaim
The glory and the greatness of His name.

—David Banks Sickels.

YOU WILL NEVER REGRET.

Helping others.
Living a clean life.
Paying your debts.

Refusing to do a questionable thing.
Giving a lift to a fellow that's down.
Keeping the cleanest bakery in town.
Being "on the square" with everybody.
Having patience with cranky customers.
Shutting your ears to a "smutty" story.
Yielding to the impulse to do a good deed.
Earning the name of making high quality goods.
Declining to do a foolish thing because competitors do it.—Bakers Helper.

HOMELY HINTS.

To remove hot tea and coffee stains, soak the stained fabric in cold water, wring, spread out and pour a few drops of glycerin on each spot. Let it stand several hours, then wash with cold water and soap.

If a varnish or paint stain is on a coarse fabric, dissolve by saturating it with turpentine. Use alcohol if on a fine fabric. Sponge with chloroform if a dark ring is left by the turpentine.

To drive flies from a room try the following: Close the room tightly, smolder some cayenne pepper on a hot coal, open door quickly and the flies may be driven out easily.

To Wash Pongee Silk.

Do not wring pongee silk. It is better to let it drip dry. Iron with a moderately hot iron when very dry, and do not sprinkle at all.

To Engrave Eggshells.

Make the drawing of any figure or design you please upon the egg in melted tallow or any thick oil. Then immerse the egg in strong vinegar. When the egg has remained for some time in the vinegar it will be found that the parts untouched by the tallow have been eaten way, leaving the design in relief.

For Keeping Sash Curtains Clean.

When you get window rods for either top or bottom buy a small can of white gloss paint and a small brush; give the rods a coat and when dry give them another coat; the more they are done the better it makes them. They don't bend so easily or get out of shape. No matter how nice or fine the curtains are they will come off as nicely as they went on; the paint will not allow them to rust.

To Wash Wool Crochet Articles.

Wash in warm suds; when nice and clean lay in sheet and hang sheet on line; they will come out looking as good as new.

A Simple Device.

Some time when you are in need of a little hot water and the fire is low, take two wooden chairs, stand them back to back about 2 feet apart, hang a tin pail full of water on a pole (the broom handle will do.) and rest either end of the pole on the top of the chairs with the pail in the middle. Then set a lighted lamp, the larger the better, on the floor under the pail, and the water will quickly heat. One can make tea, or in time boil eggs or potatoes that way.

* * *

When doing stencil work dip the stencil, after the design is made, into hot, melted paraffine and let it harden. This prevents the blurring of the colors, and the stencils wear much longer.

* * *

A coal bucket that had become worn enough to sift coal dust over the floor was repaired by fitting a new bottom of heavy cloth, and then the whole received a coat of new paint.

* * *

During damp weather salt shakers are apt to become clogged. By placing a few rice grains in each shaker and adding the salt last the delivery is better.

* * *

When cutting fudge when cold, or any candy, if it does not cut nicely, try heating the knife and it will cut much easier.

GRANT AND RELIGION.

Grant's respect for religion was quite consistent with his high moral attributes. It has been most truly said of him that he was never profane or vulgar. His friends and intimates can bear ample testimony to this commendable part of his private character. He had promised his mother never to utter an oath, and had faithfully kept his word. He could be emphatic enough in his conversation, his orders and his writing, to make oaths of any kind entirely unnecessary. No one who knew the man would venture a questionable story in his presence. On one occasion, after a dinner, a guest, in venturing an anecdote, asked in a furtive way if any ladies were within hearing. The General, then President of the United States, simply replied: "No; but there are some gentlemen present," and showed his readiness to leave the room.

A HELPFUL CHILD.

Little Frank, watching nurse empty a hot-water bag, asked why she blew air into it.

"It keeps the sides apart, so water will run into it easily."

Later in the day Frankie was discovered holding between his knees a lean, stray kitten, while, with cheeks distended, he blew down its throat through a tin pea-shooter.

"What are you doing?" nurse cried, rescuing the tortued cat.

"Keepin' her sides apart, so's she can d'ink milk," responded the young philospher."—Judge.

Calamities often breed success.

Every sheep has his price.

The Produce Markets

Los Angeles Markets

LOS ANGELES, July 29, 1908.

Butter.

Butter remains exactly as last week. Market is firm. Trading is quite active, but there seems no indication of immediate rise. Actual selling price is 2½c in advance of quotations.

Wholesale quotations now are:

Creamery ex per roll....50
Firsts....47½
Dairy....25
Cooking....25
"Butterine"....15@20

Cheese.

Cheese has declined and at present is very weak. It is said that cold storage has enough cheese to supply needs of this market for six months.

Southern California....14½@17
Northern fresh....13¼
Longhorn....17
Eastern singles....16
Cheddars....17
Imported Swiss....28@30
Swiss....16½@17
Oregon....15
Limburger....17½

Eggs and Poultry.

Eggs held as quoted last week until Monday when a one cent advance for local candled was made. Eastern fresh are also higher and firm.

Eggs local candled....29
Eggs case count....25½@26
Firsts fresh....28
Eastern fresh....25½
Storage....22@23

Wholesale prices..

Hens per lb....10@12
Young roosters per lb....17
Fryers....15@17
Broilers per lb....15@17
Roasters....16
Old Roosters....7
Turkeys....16@18
Geese....11@13
Ducks....10
Squabs....1.25@1.50

Live Stock.

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs from 175 to 200 pounds..6¼ @6½
Prime steers....4¼
Heifers....3½@3¾
Calves per lb....4½
Sheep ewes per head....3.75@4.00
Lambs per head....3.00@3.25
Wethers....4.00@4.50

Potatoes.

Potatoes have shaded slightly and potato men are asking as to the future of the market. A car of Northern Highlands was received Thursday and was held at $1.25, but no sales were made.

Wholesale prices are:

Sweet potatoes per bx new crop 2.00

Hay.

SOMERS & CO. say:

There has been at least a 25 per cent increase in hay shipments duing the past week over the week preceding; the total showing 3770 tons in comparison with 2910. Because of this increase the steady trend of the market towards a higher range has been checked and more moderate prices are now in evidence. At about the latter part of last week quotations were holding at an extreme range; many sales of choice wheat hay being affected at $18.00 per ton. Prices are now back to where they were a week ago and if cars are provided in ample numbers there will surely be a still further decline, as large quantities of hay are awaiting rail transportation at many points.

Local business continues very dull with wholesalers and retailers alike complaining seriously. The larger local consumers such as the draymen and stablemen are reporting a very dull business and most of them are arraiging to send out quite a portion of their stock for fall and winter pasture. On the whole, the outlook is not at all encouraging for with almost a cessation in export business it begins to look as hough even the light hay crop throughout the State this season might eventually become a drug on the market. Only with decided business improvements along all lines will we have a satisfactory hay market throughout the winter unless, of course, a dry season should threaten.

WHERE OUR CLOVES COME FROM.

Frank G. Carpenter, in a recent letter written in Zanzibar and published as a syndicate letter in some of the leading daily papers of the country, tells us all about the "clove island of the world" as follows:

In coming here from Tanga we steamed along the Zanzibar coast for about forty miles, and there are twenty or more miles yet below us. Zanzibar is about fifty miles long and twenty miles wide, and it would make altogether about 400 one-thousand acre farms. As you look at it from the sea the land is low and its shores are fringed with cocoanut trees loaded with nuts. The island has a dense vegetation. It is in the heart of the tropics and is noted for the fertility of its soil. It is the chief clove island of the world, and the cakes and pickles of the universe are flavored by it. Throughout Europe and the United States there are millions of secret drinkers who hide their whisky breath from the knowledge of their deluded wives by the aroma of Zanzibar cloves. The island produced last year over 26,000,000 pounds of these spices. This is enough to smother the scent of all the liquors raised by man and leave some to spare.

During my stay I have ridden out to some of the plantations. Cloves come from trees which are set out in orchards and cultivated. At the age of six years the trees begin to bear blossoms, and it is these blossoms which form the cloves of commerce. They are bright red in color and are full of perfume. They are picked when they are in bloom and then smoked over slow wood fires. During the smoking they turn from red to brown, and when cured are almost black. After they are well dried they are packed up in bags, and in that shape are sent to Europe and the United States. The English have another clove island, known as Pemba, which lies a little north of Zanzibar, and is governed from here. These two islands produce more than 90 per cent of all the cloves raised in the world.

Amity, Yamhill county, Oregon, has a cream factory which handles 20,000 pounds of milk daily.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Veterinary School.

Will you please tell me if there is a veterinary college in California, and if so, where it is?—N. R. G., Upland.

Address San Francisco Veterinary College.

THE AUGUST CENTURY.

There are ten short stories to entertain the summer idleness of the readers of the August Century, the Midsummer Holiday Number.

A delightful literary feature of the issue is "A Group of Aldrich Letters"—letters to such interesting personalities as Taylor, Lowell, Fields, Stoddard, Stedman, Howells, Clemens, Woodberry—edited, and with comment, by Ferris Greenslet. Then there is a new "Travels with a Donkey" sketch of wanderings in Normandy; "When We were Tramps," by Francis Wilson's daughter, with plenty of pen and ink drawings by her husband, Charles Huard, evidently one of the "tramps."

Robert Hichen's "The Spell of Egypt," and two delightful pages in color by Jules Guerin, deal with the Ramesseum and Deir-el-Bahari. "The Reminiscences of Lady Randolph Churchill" take us to Japan. The color frontispiece of the number is a reproduction of Elizabeth Howell Ingham's drawing, "The New Novel in the Forties."

A JUST DECISION.

A recent decision of the United States Circuit Court of New York in the case of the Vermont Farm Machinery vs. the Sears-Roebuck Company, brought to prevent infringement on separator patents, gives victory to the Vermont Farm Machinery Company, and is received as a just decision. The farmers who have bought these separators which are infringements will, doubtless, have recourse on the company of whom they purchased. The decree requires of Sears-Roebuck Company to furnish the plaintiff with a full list of all purchasers of the infringing machines.

There are too many good separators made to make it profitable for the dairymen to waste any time and money on these cheap machines, which are liable to be infringements.

Jack rabbits are menacing the crop at Hesperia.

Smith's Fruit Gatherer

A fruit gatherer that enables two men to do the work of six and not bruise or soil the fruit. Cut shows only one-half of machine. Good for fruits, nuts and olives. Can be furnished on short notice. Circular and prices by return mail.

The Growing of the California Walnut

J. B. Neff of Anaheim Gives a Bit of Walnut History and Cultural Information. Part of a Paper Read at the State Fruit Growers' Convention at Riverside Last May.

WHEN walnuts are spoken of in California it is always understood that softshell walnuts are meant, and softshell walnuts are becoming known in the markets of the United States as "California Walnuts." This being the mark of excellence and used to distinguish them from imported walnuts.

These were formerly known as English walnuts, probably because of having been marketed by English merchants when all walnuts were imported, but likely originated in Persia or Asia Minor, though it has been found native over a wide area, including the mountains of Greece, of Armenia, of Afghanistan and the northwest Himalayas. It is also found in Japan and has been reported as growing on the highlands of the Congo, in Central Africa.

Walnuts from Persia were brought to Rome by merchants and from there the trees were distributed over Europe and to America.

There are no records to show when the first walnut trees were planted in California, but the best authorities say that it was about the year 1769 and that the planting was done by the Mission fathers. Very few trees were planted after this first planting for nearly one hundred years. About the year 1843 a few trees were planted at San Diego by J. J. Warner, and in 1848 F. E. Kellogg, Sr., planted a small orchard at Calistoga, in the upper part of Napa valley. J. R. Congdon planted an orchard at Capistrano in 1869. H. K. Snow and P. T. Adams planted the first walnut grove in the vicinity of Tustin and Santa Ana in 1879. The planting was an orchard of eight acres, which was characterized as a rash adventure by the neighbors, but the soundness of their judgment is shown by the fact that the orchard is one of the best producers in the valley after more than one-third of a century has passed. These early plantings were all of hardshells.

A few years later some additional acreage was planted by Snow and Adams until 15 acres were in one plot. The trees were planted too closely and ten years ago they began to take out alternate trees. The orchard has been abundantly fertilized lately with stable manure and the production last year was 25,800 pounds.

The softshell walnut originated in Santa Barbara county, on the farm of Joseph Sexton, and came into notice in 1880. It is supposed to have been the result of cross pollination between hardshell and papershell walnuts, but is more likely to have been a seedling of the hardshell, showing one of the many changes that may be expected of seedlings. Softshell walnuts soon became popular and have been planted exclusively for the past twenty years under the name of Santa Barbara softshells, but this term does not mean any particular variety and includes all seedling softshell walnuts generally found in the market.

There are but few walnut groves of commercial importance north of Santa Barbara county, though there are some small orchards in the Sacramento valley and several small areas in Santa Clara county and near Santa Rosa. The walnut trees of the northern part of the State are mostly of the French varieties, and largely Franquette, as it has proven the most productive, though not equally successful in the southern counties.

Large plantings of grafted and budded walnuts have been made in southern counties within the last ten years, and almost the entire planting of the northern counties are grafted trees. The variety mostly propagated in the south is known as the Placentia Perfection, and originated in the Placentia district of Orange county about 18 years ago. This is a vigorous, upright growing tree which produces large, smooth nuts that hull freely and are well filled with white meat, but while it gives better returns, both in price and production than the average seedling softshell, it will sometimes lose half its crop by blight.

The stocks used for grafting and budding have been largely seedling softshell in the south, while that used in the north has been mostly native black walnut, and very frequently these are not grafted until ten to fifteen years old.

Walnuts should be planted only on good, deep soil, not underlaid by hardpan, nor where the water will stand on the surface. A deep sandy loam is to be prefered, but walnuts will do well on the heavy soils that are free from alkali. Good drainage is always necessary, as well as freedom from late frosts and a comparatively cool climate. The greater part of the orchard planting has been 40 feet apart. This is too close on good land and better results can be had by planting 50 feet apart, while 60 feet is not too far in some cases. The planting is generally done with the object of getting a larger number of trees to the acre instead of getting the maximum production of walnuts from the tree, and increasing its length of life. An orchard may be made to pay a good income early in its life by planting 50 feet apart in squares, with a tree in the center of each square which can be taken out after 12 to 15 years. In this way the profit from the interset trees will often be enough to pay for planting and land by the time they have to be taken out. It is necessary to have water for irrigation in most places as the walnut tree needs more water than it usually gets. Walnut trees do not require the heavy pruning that is needed by most deciduous fruit trees. The lower limbs should start at four to five feet from the ground and in such a way as to have the heavy side of the tree to the southwest. A good rule for the early pruning is to cut off only those branches in the way of the team when cultivating, or that will draw the tree too much to the northeast or away from the prevailing winds. When the trees are eight to ten years old there will be small branches in the center that shut out the sunshine which should be taken out, together with all branches that are crossed. There will be no walnuts in the center of the tree unless there is some sunshine through the tree. A good deal of labor and time can be saved if the trees are gone over in June and the long and useless shoots taken off. It may also be necessary to go over them again in July, but the work at that time will be light.

The young trees should be supported by stakes for the first two or three years. A convenient stake is made by using redwod 2x2x9 feet long. This makes a stake long enough to use for support for branches that may be drooping and these branches may be trained in the proper direction by using short lengths of light baling rope to give the branch the proper angle.

A walnut orchard that has been well cared for will begin to bear paying crops after the fifth year from planting and should increase in production for many years. Walnut trees will live to a great age in suitable localities and with proper care. Trees in the south of France and in Spain that are believed to be more than 300 years old bear regular and heavy crops.

IN GOLDEN GATE PARK, SAN FRANCISCO.

A blight of both nuts and green twigs began to attract attention about nine years ago; the Department of Agriculture at once instituted investigations which were supplemented, and are now being carried on by the University of California, but the idea of finding a remedy for the blight has been to a great extent abandoned and attention turned toward solving the problem by finding trees that are resistant to the blight to such a degree that they will produce paying crops under the same conditions which cause other trees adjoining them to lose the greater part of their crop.

A series of investigations has been made with a view of getting a tree that will be resistant to a great degree, and at the same time produce large crops of desirable walnuts, from which to propagate by grafting or budding. The investigations give much hope, as several such trees have been found, and with added interest that is taken some very excellent trees are likely to be found.

Gum Disease of Citrus Trees

By Prof. Ralph E. Smith of Southern California Pathological Laboratory, at State Fruit Growers' Convention, Riverside.

The following is from the address by Mr. Smith delivered at the State Fruit Growers' Convention at Riverside. It is a part of the address which appeared last week and which, by error was not credited to Prof. Smith.

UNDER the general term "gum disease" are included several troubles of a more or less distinct nature. Of these may be mentioned particularly the gum disease of the lemon, the scaly bark of the orange and the true Gummosis, or Mal di Goma of Europe and Florida. The last mentioned disease is quite distinct from the most common forms of gum disease which occur in California. It is characteristically a disease of the root rather than of the trunk and may be described as a root rot, more than a simple gumming. We have seen this trouble only in a very few instances in California. It affects the tree mostly from the surface of the ground downward and shows itself as a softening and decay of the bark, finally affecting the whole root. So far as seen here it appears to be due to an excessive amount of moisture about the trunk, particularly when accompanied by banking of the earth closely around the tree above the normal height.

The Lemons.

The gum disease of the lemon manifests itself as a breaking out of gum on the trunk, usually between the point of budding and the main forks of the tree. This disease has been much discussed of late in the horticultural press and elsewhere, and the conditions which produce it are quite generally understood. It is without question entirely physiological and not brought about or concerned in any manner with any fungi, bacteria or other parasites. It occurs almost always in heavy ground in places where moisture is too abundant, and particularly where the soil has become compact about the trunk above the point of budding. Instances are practically unknown of lemon trees being affected, save under conditions of this sort.

The lemon gum disease may be avoided in no other manner than by avoiding these conditions which bring it about, or when once started may be remedied in no other manner than by improving conditions. This may be done very largely by cultural means, consisting of loosening the soil thoroughly about the trees, uncovering roots which are too deeply buried, avoiding saturation of the soil close about the tree, and, if feasible, replacing the heavy soil with sand or gravel in a circle about the tree. If planting in soil which is manifestly liable to the disease two things are strongly advisable. First, the use of the bitter orange or so-called Florida sour stock for a root; the second, the practice of high budding, working the tree about fifteen inches from the ground. In the case of trees already affected it is often advisable to remove the bark which has become separated from the wood and killed by the exudation of gum in order to give an opportunity for new bark to form and the wound to heal over. This treatment is in no sense a remedy for the disease but simply a method of wound treatment as might be applied in the case of any injury. All bark which is badly affected should be stripped cleanly from the tree, trimming neatly about the edges of the sound bark, and the exposed wood should then be covered with some material for which a wax, composed of four parts resin, one part beeswax and one part raw linseed oil, boiled together and applied as a liquid with a brush, is as good as anything. It is also advised to slit the bark of affected trees up and down the trunk in several places. Orange trees are sometimes affected in very wet ground.

The Orange.

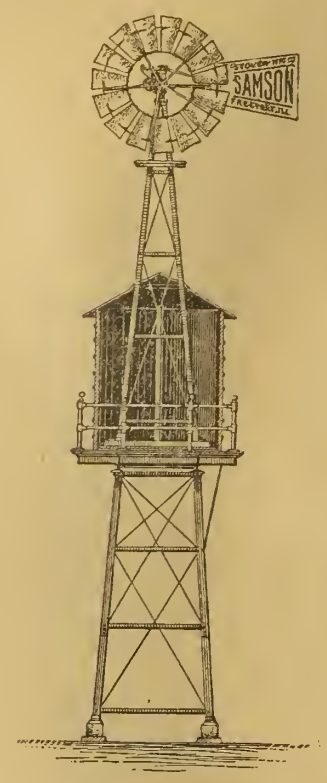
The scaly bark of the orange is of a nature much less easily explained. The manner of its occurence, affecting the trees here and there about the orchard, makes it difficult to understand how it can result from conditions which seem practically alike all over the orchard. The disease is limited to the sweet orange, not affecting the lemon, grapefruit or other species, and is much more common on seedlings and navels than on the Valencias. It manifests itself as a scabby, gummy breaking out at any point on the trunk or branches, and usually keeps spreading about the trunk or along the branch from year to year. We can only say in regard to the nature of this disease that the condition of the affected tissues when studied with the microscope is similar to that in the lemon gum disease. There is the same breaking out of gum through the bark, with the difference that in this case it is less abundant and active and takes the form of a mild irritation which keeps the affected area continually spreading at a limited rate. In our opinion the disease is connected with an irregularity in the flow of sap up into the tree, starting primarily in an irregular water supply to the roots, the trouble resulting from interference with the flow of sap on account of the structure of the wood, as has been previously mentioned. We feel quite well satisfied that the disease starts as a result of an abnormal relation between the flow of sap and the structure of the wood which should conduct it, however obscure may be the cause which first brings this about. We have seen cases of successful treatment of scaly bark areas on orange trees, when not too large, by cutting out all the affected part and covering the wound with the wax described above. In doing this it is necessary to cut away all bark which shows discoloration between it and the wood beyond the portion where the surface shows the scaly condition. This is found particularly just above the visibly affected portions. The practice of covering portions of trees affected with scaly bark with a thick paste composed of lime and sulphur is sometimes resorted to. We have not been able to observe any very decided or permanent benefit from this treatment.

DIE BACK.

Florida die back, or exanthema, is another disease which may be included in this class and occurs to some extent in Southern California. This is a disease of very pronounced symptoms, both on the fruit and twigs. It affects particularly the orange. The affected oranges show dark brown discolored patches on the side and from these places the fruit often splits. The oranges have a characteristic pale yellowish-green color and are

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

KELLOGG'S ANT PASTE CO.

1010 East Ninth Street Los Angeles, Cal.

quite sweet when not more than half grown. The branches die back from the tips, send out clusters of small shoots from the twigs, and the bark of the latter breaks out in corky protuberances or pustules. More or less gumming is associated with the latter. This disease is described in Florida as being due to an excess of organic nitrogen in the soil. That this is not entirely the case but rather that its cause is more complicated than this is shown by the appearance of the trouble in this State, where it is limited almost entirely to a certain type of soil. This is the coarse, granitic, very porous soil which is found particularly along the base of the mountains in various places between Highlands and Pasadena. On such soils the Florida die back is of quite frequent occurrence. There have been a very few cases of the disease on heavier soils where the Florida experience seems to hold true, all the instances on such soils of which we are aware having been associated with very heavy applications of fertilizers rich in organic nitrogen. In the case of the type of soil mentioned, however, the disease occurs very severely in many instances where only moderate amounts of fertilizers have been applied. The most pronounced quality of this soil is the free passage which it affords to water. It becomes very wet during irrigation, but unless water is applied very thoroughly and carefully and quite frequently the upper soil becomes absolutely dry between irrigations. This soil also takes up water very poorly in a lateral direction so that the space between the trees and much of the whole body of soil becomes extremely dry in many orchards. The disease appears to be brought about in some manner through an irregular food supply, resulting from the irregular water supply which trees get in this soil unless irrigation is particularly well carried out. With trees which are not well fertilized the effect is simply one of ordinary die back. True exanthema seems to result where the soil is of the type described and a fair amount of fertilizing material has been applied. It is apparently a sort of indigestion in the tree, more food being taken up during irrigation than the tree can take care of after it gets into the condition of dryness which follows. On heavier soils the same thing occurs only where very excessive amounts of nitrogen have been applied.

Cases of ordinary die back, failure to grow, poor development, mottled leaf, poor production, barrenness, etc., are of very frequent occurrence, but cannot be ascribed to any one cause or considered as representing any special form of disease. These conditions result in a great majority of cases from failure of good cultural methods or unfavorable conditions in the location of the orchard.

With the orange the fruit itself is affected by two very characteristic troubles, both apparently due to irregularities or abnormal conditions in the development of the fruit, from causes which cannot be fully explained. We refer to the puffing and splitting of the fruit. We can give no information of definite value as to the exact nature or means of control of these troubles.

In regard to the treatment or means of avoiding the various diseases which have thus far been mentioned, we can give no absolute rules to fit all cases, but in this connection the following remarks by Mr. C. C. Chapman, at the Citrus Convention held in Riverside January, 1907, are very suggestive:

"There are certain general conditions which I believe are applicable to all of Southern California. First, I think it is an essential requirement that you should keep your grove absolutely in an even condition, never have it call for anything; never have it need irrigation; never have it need fertilization; never have it need anything, so far as indications are concerned. That is, you don't want a grove to show you that it needs anything. You don't want it to arrive at that condition where it will show this."

We can give no better advice than to emphasize what Mr Chapman has said as to the importance of maintaining a uniform, even condition and growth of the citrus tree, avoiding all extremes and sudden changes which would tend to produce irregular development. Whatever may be the exact nature and cause of these obscure troubles, it is certain that they all have their origin in irregularities of growth or functions as influenced by natural conditions or the treatment which the tree receives. The peculiar sensitiveness of citrus trees to the effects of such conditions makes it particularly important that their vital processes be kept in a uniform condition, free from violent shocks. So far as climatic influences are concerned this cannot be entirely accomplished, but in his manner of soil treatment as related to irrigation, cultivation and fertilization the grower should study each peculiar type of soil most carefully, endeavoring to maintain the most uniform possible condition as to water and food supply.

These troubles being of a physiological or autogenous nature, rather than the effects of parasitic organisms, any application to the tree of the nature of a fungicide or insecticide is ordinarily out of the question. In the case of the Florida die back beneficial results have been claimed from spraying with the Bordeaux mixture, in which case it is possible that the application of this substance to the foliage has had some physiological effect.

Cold storage of fruits has its problems as do other phases of the fruit industry. To one of these problems, that of the susceptibility of stored fruit to various rots, Bulletin No. 297 of the New York Agricultural Experiment Station, Geneva, contributes valuable data. The experiments show that certain rots are perfectly controlled at temperatures ordinarily used in cold storage, but that blue mold is still active at or just above the freezing point. A method of destroying the germs of the fruit-rot fungi is also given. Both storage warehouse men and fruit growers should know the facts shown by this bulletin. It may be secured without cost, by writing to the station for it.

More Fruit and Better Fruit
result from the liberal use of
POTASH

Apply at least 1000 pounds, to the acre, of a complete fertilizer containing from 10 to 12 per cent. of Potash. The result will be better growth of tree, vine or bush, higher yields of better colored fruit with superior eating and shipping quality.

Our free booklet, "Plant Food," is full of information about plant fertilizing that every fruit grower should have. Send for it.

WILLIAMS & SON, Manufacturers
Orange, California

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Deciduous Fruit Culture

MORE ABOUT CREATING HUMUS.

BY WAY of emphasizing some points in my article in your issue of July 2, I should like to make some further remarks.

As a preliminary, however, I may say that many people who have sound ideas and start enthusiastically to working them out, are "scared out" and discouraged by the first setback or difficulty of any kind that they encounter, and abandon the undertaking, so the case of the grower at San Gabriel does not prove anything. Then, too, he might have left all of his land unplowed or might have done something else causing him to encounter many difficulties which the system of plowing alternate "middles' on alternate years does not encounter.

Again, the fact that the majority of growers are not following this plan does not prove anything either. It has finally just begun to penetrate the densely dull public consciousness that the majority of the owners of timber land are pursuing a ruinous policy, both as to the immediate welfare of the land and the public welfare in general, and it is entirely possible that it may soon be shown beyond argument that the present policy of our agricultural majority is equally deplorable. The two are almost identical.

The present system has grown up out of a stupid and ignorant past. Our fathers, when they wore out one piece of land, simply moved onto another. Now we can't do that, so we must exert our thinking faculties a little instead, or "bust."

In this particular locality the first fruit growers were gardeners and used gardeners' methods. The later arrivals simply copied them.

The rainfall at Newcastle averages near 30 inches and is the immediate cause of our having to face this problem sooner than some other localities. The heavier the rainfall the greater the erosion, and that is where our humus goes.

Any careful study of the matter will show conclusively that the amount of humus consumed in crops is as nothing when compared with the amount we wear out cultivating or which a liberal rainfall washes away from a "well cultivated" soil, to say nothing of the possibilities of careless irrigation in this regard.

The agriculturist, where there is no rainfall, has only the wear of cultivation and the erosion due to irrigation to contend with, hence he stands it longer.

I can readily show the doubter tracts of land in parts of California enjoying a rainfall of 50 to 60 inches, that have been rendered entirely useless within a term of ten years of orthodox cultivation. The soil was not "poor" and was not impoverished by the crops taken from it, but simply by the fact of having all of its better part washed away, so it is plain that our rainfall is not an advantage.

I do not think that temperature enters into the problem. The ground certainly gets as hard and dry here as it does in any irrigated district and humus is certainly more valuable at 120 in the shade than at 100.

We are not in the fig growing business to any great extent, but grow peaches, plums, pears, cherries and grapes. They all show equally satisfactory results. Where formerly they were irrigated weekly with indifferent results they are now watered once in two or three weeks with good results. The total amount of water used is the same, it simply takes longer to get around on account of the increased absorbing capacity of the ground.

Where formerly both irrigating and rain water escaped from the orchard in large quantities and heavily laden with silt, now but little escapes and it is clear.

A neighbor recently showed me, with pride, his splendid potato patch, on made land. It consisted of a number of embankments across a canyon which had impounded silt, often to a depth of 16 feet. When I asked where the silt came from he pointed to the orchards on the adjacent hillsides. They had contributed thousands of tons of their cream to that potato patch, about which he felt quite virtuous and thrifty.

He is laboring under a three-fold waste: First, a waste of labor in doing needless cultivating; (his land is as weedless as ours once was.) Second: A waste in trying to haul enough fertilizing material to offset the soil exhaustion from which he suffers ;and, third: A waste in building the embankments to impound the silt.

How much more sane to so handle his land that there would be no erosion, no silt, no embankments and little if any fertilization. Instead, he should have a constantly increasing supply of the invaluable humus, made in nature's way, and this with less labor and expense than is necessitated by the most destructive method so popular with the dear majority.

The agriculturist who uses up his present supply of humus, which is really his entire capital, without making adequate provision for putting an equally large amount back into his soil, is in exactlly the same class as the fellow who killed the goose that layed the golden egg, the fellow who chops down his tree to get the fruit thereon, the prodigal youth who "blows in" his patrimony, and various other wise people that we have all heard of.

This custom of the blessed majority accounts for the decline in productivity of California grain fields; it accounts for much of her small and defective fruit, and it accounts for the abandoned farms of the Eastern States.

Many of us have doubtless noticed the fence corner that is neither tramped, pastured nor plowed; how its grass grows rank and ever more rank until finally it reaches mammoth size and the ground becomes so "mellow" and "rich" that its surface is well worthy of being hauled away to some "better(?) cultivated" part of the orchard or farm, for fertilizing purposes. Even though the roots of a neighboring tree reach this corner and draw on it liberally it goes right on improving.

We have likewise, no doubt, noticed the tree or block of trees that, in ten years, have not borne anything like a crop of fruit, but have been industriously cultivated all the time just the same. The ground around these trees has deteriorated just about as rapidlly as that around the adjoining block that has borne all the time.

The plan of plowing alternate "middles" on alternate years is simply putting in action nature's system of holding onto the humus she has now and providing for more. To be sure, under this method she is only making humus half of the time, but that is sufficient. We do not have to work all of the time to live; nor do we have to sleep all of the time in order to rest sufficiently.

As for argument: Facts talk louder than doubts, and I can show plenty of them to him who wants to know.

This plan has the full sanction of those in the highest positions, agriculturally, in the country, but they say that the storm of denunciation that assails them whenever they advocate anything so radical, to the elect, is rather more than they care to face.

Great is bigotry. The roots of prejudice are deep and strong.—Gerald Geraldson, Newcastle, Placer Co.

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

Fruits and Produce Under the Dingley Tariff

In answer to the question often asked as to products of farm and orchard which are protected under the Dingley tariff, we quote the following products:

FRUITS.

Apples, green,	25c per bu.	Apples, dried, or prepared	2c lb.
Berries, green,	1c qt.	Berries, dried or prepared	2c "
Citron, prep.	4c lb.	Citron peel, dried or prepared,	4c "
Cranberries, gr.	25 % adv.	Cranberries, dried or prepared	2c "
Currants, Zante, etc.			2c "
Cherries, green	25c bu.	Cherries, dried or prepared	2c "
Cherry.. juice,	60c gal.		
Dates,			½c "
Figs,			2c "
Fruits, (edible) dried,			
Grapes, dried,	2½c lb.	Grapes, bbls. or pkgs,	20c Cu. ft.
Grapefruit, green,			1c lb.
Jellies, (all)			25% adv.
Lemons, green,	1c lb.		
Limes, green,	1c lb.		
Oranges, green,	1c lb.		
Olives, bot., etc.,	25c gal.	Olives, casks,	15c gal.
Olive oil,	40c gal.	Olive oil, bottles,	50c gal.
Peaches, green,	25c bu.	Peaches, dried, etc.	2c lb.
Peach brandy,	$2.25 gal.		
Plums, green,	25c bu.	Plums, dried,	2c "
Pears, green,	25c bu.	Pears, dried,	2c "
Prunes, dried,	2c lb.		
Prune juice,	60c gal.	Prune wine,	60c gal.
Prunella, dried,	2c lb.		
Pomelos, gr.	1c lb.		
Pineapples, pres	25% adv.	Pineapples, bbls. & pkgs	7c cu. ft.
Quinces, gr.	25c bu.	Quinces, prep	2c lb.
Raisins,			2½ "
Shaddock, gr.	1c lb.		

Sweetmeats, comfits, fruits, preserved, etc. 1c lb. 35% adv.
Free list.....fruits or beries, green, ripe or dried, and fruits in brine not especially provided for in this act.

FARM AND FIELD PRODUCTS.

Albumen, egg or blood,			3c lb.
Almonds, shelled	6c lb.	Not shelled	4c "
Beans, prep. or pres	2½c "	Beans,	45c bu.
Blood, dried or soluble,			1½c lb.
Cabbage,			3c each.
Cider			5c gal.
Castor beans, per bu. of 50 lbs			25c
Castor oil,			35c gal.
Cotton seed oil, per gal. of 7½ lbs			4c
Eggs,	5c doz.	Eggs, yolks of	25% adv.
Fish paste, pickles, sauce,			40% adv.
Flaxseed oil,			20c gal.
Filberts, shelled,	5c lb.;	unshelled	3c lb.
Garlic,			1c lb.
Hay			$4 ton.
Honey			20c gal.
Hops,	12c lb.	Hop ext. & Lupulin	50c adv.
Linseed oil			20c gal.
Mushrooms, prepared			2½c lb.
Nuts, all kinds, shelled or unshelled,		not pro. for	1c lb.
Onions			40c bu.
Potatoes			25c bu.
Poppyseed oil			20c gal.
Peanuts, shelled	1c lb.	not shelled	½c lb.
Peas, green or split,	40c bu.	dried	30c bu.
Peas, prepared or pres	2½c lb.	small packages	1c lb.
Seeds (oil)	25c bu.	seeds (not oil)	30% adv.
Straw			$1.50 ton.
Teazles			30% adv.
Vegetables, prep. or pres.	40% adv.	Vegetables, natural	25% adv.
Walnuts, all kinds shelled	5c lb.	unshelled	3c lb.

Free, Brazil nuts, Cream nuts, Palm nuts, Cocoanuts, in shell or broken meat or copra.

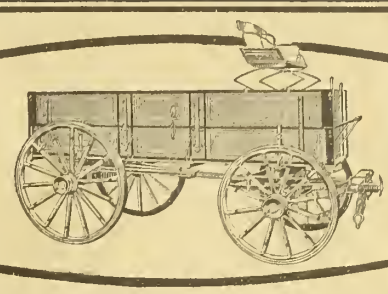
SOIL ANALYSIS.

The chemist can take any sample of soil, analyze it and tell precisely all the elements and the amount of each that it contains. From this fact many farmers think that if they could only have their soil analyzed, they would know precisely what elements of plant food are deficient and know just what fertilizer to apply. Few agricultural chemists claim to be able to accomplish much in this way. Their methods enable them to get every atom of plant food out of the soil but much of this is unavailable to plants, is so locked up that they can't get at it. How much of it is in this condition even the chemist can not tell. But plants can tell and the way to learn is to ask them. With all the help the scientists can give us, the individual farmer must still solve his own problems. If unsatisfactory yields convince you that one of your fields is deficient in one or more elements of fertility conduct a little experiment of your own. While there are more than a dozen elements that plants feed on, there are only three tnat are likely to be depleted. These are nitrogen, phosphoric acid, potash. Measure off an acre of the uniform soil 16 rods long by 10 rods wide. Cut this into five strips 16 rods long and two rods wide. On first strip apply nitrogen, on second phosphoric acid, on third potash, on fourth nitrogen and phosphoric acid, on fifth nitrogen and potash. At harvest time note carefully difference in crop on different strips and compare with crop on each side of plots which was untreated. For sure conclusions, crops should be weighed. Many soils are acid and refuse to properly grow alfalfa and clover. Lime will correct this acidity. If you have trouble in getting stands of either of these crops, test soil in same way by use of lime.

The experiment stations of Ohio, Indiana and Illinois agree that many of our long tilled soils are deficient in phosphorus, and it is generally agreed that the growing of the legumes is the cheapest way to secure nitrogen.—The Epitomist.

Salem, Oregon, cannery has notified all cherry growers that no more cherries can be received this season. The claim is put up that the demoralized condition of the canned fruit market is the cause of the order.

THREE HIGH CLASS FARM WAGONS



A FARM wagon has much hard work to do. It must haul heavy loads, travel over rough roads and be out in all kinds of weather. When you buy a farm wagon you want to get many years' service from it.

You will not be disappointed if you buy any one of the three wagons described below.

The 63-Year-Old Weber

The King of all farm wagons. Only the very best and most thoroughly seasoned wood is used; ironed to make a wagon that lasts a lifetime. Light running, convenient and a wagon of fine appearance.

The Popular Columbus

Built in a factory where most exacting conditions are enforced. Air seasoned wood stock, ironing which gives great strength and durability, workmanship by thorough mechanics and every part thoroughly tested.

New Bettendorf Steel Gear Wagon

Front and rear gears made of steel. Parts riveted together, not bolted. A wagon that is proof against breakdowns. Nothing can work loose or rattle, and there can be no warping, drying apart, shrinking or rotting.

You should remember above everything else that a cheap, poorly constructed wagon is dear at any price.

Before you buy any wagon call on the International local agents and learn all the superior points of the Weber, Columbus and New Bettendorf wagons. They will show you the wagons and hand you printed matter giving all particulars. Or if you prefer write nearest branch house for full information.

ORIGIN OF CORN.

When Columbus reached Cat Island on that fateful day of 1492, he found the poor savages cultivating a plant that was new to the Spaniards. Later, when they saw the islanders gathering from the stocks a material which they used for food, the Spaniards took a curious interest in their actions. This plant, which the natives called "Mahiz," was wholly unknown in Europe or any other part of the old world. Afterwards the Spaniards themselves cultivated this plant for food, calling it "maize," by which name it has since been known in the botanical world. In this small way began what is now the most important and most valuable crop in the civilized world. Looked at from the standpoint of the botanist, a strange fact is disclosed in considering the habits as well as the habitat of this celebrated cereal. It was indigenous to the two Americas, but at the time of the conquest, had made little progress toward the wonderful development it was subsequently to attain. The Indian tribes in various sections, from the Canadas to Patagonia, were found to be acquainted with its merits and depended upon it as one of their chief vegetable foods. They cultivated it in little patches, planting it in a hole in the ground made with a stick and from it made certain dishes afterward famous as "succotash," "hominy" and "hoecake."

What is especially noticeable is the fact that no other grain or vegetable has such difficulty in reproducing itself unaided as maize. Left to itself it is difficult to see how it could keep alive. The grain being encased in a thick and close-fitting shuck, and growing closely to the cob, cannot reproduce unless in falling it becomes shattered and covered. Birds and other animals might help some in this process, but not enough to greatly extend the area of its productivity. The aid of man is needed, not only to plant, but to cultivate the corn, and it is questionable whether, if left ungathered, the whole of the fields in our mighty belt, would spontaneously bring forth next season a single ear. Fortunately, the savages in a limited way assisted this wonderful plant sufficiently to keep it alive in many places until the white man came with his hoe and plow to do the work on an extensive scale. It is just possible that but for the Indians, this valuable grain might have been lost entirely to man. Its only chance of survival originally would be in the tropics, where the first grains that fell and became covered would escape freezing and thus sprout in the returning season for its propagation.

It is a far cry from the little patches on Guannahani Island to the cornfields now smiling over the United States preparatory to a production of 3,000,000,000 bushels this fall. These fields occupy an area greater in extent than the German Empire. Though every State and Territory in the Union produces corn, the principal crop comes from Indiana, Illinois, Iowa, Missouri, Kansas and Nebraska, which constitute the far-famous "corn belt." It is estimated that if all the corn produced in one year in these six States were shelled and loaded in wagons, the train would extend nearly 155,000 miles, belting the earth six times with 4000 miles of wagons to spare. Iowa alone has produced a crop equal in value to the annual output of gold, silver and lead in this whole country, or more than the net earnings of all the national banks. Our farmers may understand what is meant by improved corn culture, when it is understood that an increase of one ear in every ten in the five principal corn States would mean an addition of $44,000,000 a year to their wealth. Though the origin of corn is very ancient, its use on a large scale is very modern. Darwin, the great naturalist, while traveling in Peru, found an ear reposing in a metal vessel eighty-five feet below the present surface of the soil. Others have been found with mummies in the tombs of the Incas. The natives of Mexico, long before the conquest, worshiped a goddess corresponding to the Greek Ceres, and the method was for sun virgins to sacrifice corn cakes in her honor. The North American Indians believed that corn was a direct gift from the Great Spirit. This inspiring belief was embodied in a poetical legend, to the effect that a young warrior fasting in the wilderness, prayed for a gift for his people, when a spirit in the form of a beautiful young man garbed in glistening green with flowing plumes, descended in response and brought the grain of grains as his offering.—American Farmer.

INCREASING SOIL FERTILITY

Before attempting to increase the productiveness of the soil, it is advisable to ascertain the cause of its low crop value, if possible, and then take the proper measures to overcome these causes.

Low productiveness may be due to a number of causes, such as we have already pointed out under the discussion of soil deficiencies. It may be due to the climate or location of the soil. The soil may be too shallow, too porous, too wet, too dry; it may be acid in character or contain alkali; or it may be deficient in plant food. The general methods of increasing soil fertility are as follows:

Acid soils must be treated with lime to correct the acidity, unless crops which are not injured by acidity are to be grown.

Organic matter, if present in small quantity, should be increased by the use of manure or by plowing under green crops. In the latter event, it may be necessary to use a fertilizer containing phosphoric acid and potash to secure a good growth. The crop selected should be some leguminous crop, which will not only add organic matter to the soil, but will also take nitrogen from the air and thus increase the store of this valuable plant food in the soil.

The organic matter improves the physical character of the soil, and increases the activity of the agencies which change inactive plant food to active.

By proper use of green crops and manure, many poor and unproductive soils have been increased greatly in fertility.

Active plant food should be increased, first, from the stores in the soil by the use of green crops and manures, and second, by the use of commercial fertilizers. Except for truck crops, and other crops of high value per acre, the farmer should endeavor to secure all the nitrogen that he needs from the air, and he should purchase only phosphoric acid and potash in the form of commercial fertilizers.

The best fertilizers to be used depend upon the character of the soil, and the crop to be grown.

We believe in others but not ourselves; better begin at home.

Live Stock and Dairy

IN THE SUMMER TIME.

NOW is the time to carefully protect the pasture field against being over stocked and destroyed for next year's hay crop. The alfalfa lands are often greatly injured by August and September pasturing. The great rush of spring and early summer growth has passed and the alfalfa plant drops into a quiescent, drowsy state, like all the rest of the vegetable world. It is the time of perfecting fruits and a pause comes in the green growth of everything. The sap is ripening and getting ready for the winter dormant condition. The very bees are slow moving as they gather the honey from the sweet blue heads of the alfalfa blossoms. The cattle will tramp and tramp and stamp at the flies all over the field. The horses graze it down anxious for the tender bits at the heart; the very tops of the crown are eaten, while the rest is neglected. The very centers are all the growing portion and the alfalfa plant is weakened by this close cropping.

Prevention of Injury.

The practical farmer should have foresight enough to guard against these conditions as they come every season. Corn and sorghum or whatever soiling crop he has learned to grow, should be ready to feed the first of August. California presents the anomaly, from a stockman's point of view, of short feed in August and up to the rainy season. That is our winter time and we can readily overcome this trouble by a little seasonable care. Outside of the important matter of not over-pasturing the alfalfa, the long August days give time to clean the pests from the land. If there is any dodder in the alfalfa now is a good time to bring it under control. It gains on the alfalfa now that the season of rank growth has passed. Covering the dodder with trashy hay or strawy manure and after forty-eight hours setting it on fire will destroy the plant and any fallen seeds.

Wicked Plants.

Dodder is a peculiar growth with its long golden stems like sirens' hair. It probably possessed beautiful leaves at one time but they have passed as it did not use them for good. It probably possessed great beauty before it went wrong. It is hard to realize that there is wickedness, and robbery among vegetable life. The dodder is a thief and a hobo, living on what it can steal from its community. It starts in life from seed a perfect plant, suddenly roots itself into the stem of the green alfalfa and becomes a hanger on and a living lie. What shall we do with it? Fall indignantly on it and burn it up with straw sprinkled with crude oil. Wipe out its wicked existence like any other pest.

Johnson Grass.

Another pest, a good thing run wild, for I am told that in far away Texas it is a valuable hay producer. During the summer time or in the late spring, a sharp plow should be run over the infested land not more than two inches deep, dropping the Johnson grass on its side while in fresh growth or before it has hardened into seed. The scorching heat of the sun strikes the cut roots and they shrivel up. It is a common mistake to plow Johnson grass land deep. This merely turns the cut roots under deep in the moist earth and increases the plants by making a new one at every cut joint. The shallow turned soil is quickly heated up and the cut joints dry out and do not root. Ten days after turning the shallow furrows, harrow or rake out the joints and burn them; then shallow plow again, to catch any sprouts that may have started. A piece of two acres treated in this way was overlooked and the cut pieces were not raked up or removed, yet the results were not bad, as a man with a hoe in two hours cut off every shoot showing.

Not Theory.

Now even next year the low buried roots will not all be dead, and six or eight inch plowing would bring a renewed growth, greatly lessened, to be sure, but still there. A second year's shallow plowing will end the growth until the land is resown again by carelessly letting the grass go to seed along the public roads. This is not theory but hard practice, and when you try it please remember to make the plowing shallow, a mere surface scratching of the soil. Five years ago infested vineyards were sold off very cheap as no one wanted them. The shallow plowing was found to be successful in cleaning them. Several men made small fortunes by buying on small cash payment the Johnson grass vineyards, and after two years of shallow culture selling them, clean from the pest, at high figures, cleaning up on a land deal good money. Buying at $75 and selling at $300 or more an acre after taking off a crop is good business. The cost of this cleaning is not greater than the regular cultivation of the vineyard or orchard.

Morning Glory.

It is not a glory when it is in a vineyard or orchard, but gives rise to much annoyance and loss. It, too, yields to constant shallow plowing with raking up and burning. It, however, requires constant work every other week to subdue it. I have two experiments under way. One is smothering it with a crop of sorghum. The sorghum is away up in the air, coming into bloom with a little pallid morning glory showing up here and there. It was a dense stand of morning glory before the sorghum was sown. One dear old gentleman came to see me to inquire what the new soiling or green manure crop was I was growing on this land. The glory was so thick and the leaves so luxuriant that he thought it was some "new fangled germ inoculated peas." That was before the sorghum started to grow. On a couple of isolated spots on the land used for hay there is morning glory growing on which I am trying sulphite of iron. It makes the leaves curl and blacken. I think if persistently used it cannot help but bring things to grief for Mr. Morning Glory. This is, however, in the way of experiment and not advanced as a settled practice. Arsenical solution will certainly fix the growth, but is rather dangerous to use around a stock farm. The morning glory can be smothered out after a term of years by growing dense crops on the land, I have no doubt. Indeed, I know it is true. The crops pay for themselves, and if the land is helped with a little fertilizer it can be cropped continuously until clean and then planted to alfalfa again.

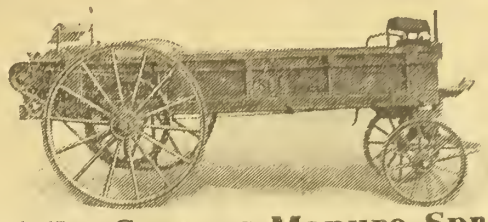
Bermuda Grass.

Much of the spread of this grass can be prevented if the seeds are burned off now. Add strawy manure or a sprinkle of crude oil and set on fire. This will limit the power of the little dickey birds to spread the seeds over clean land. The seeds should be taken care of now, and as this is not the season to handle a thickly set sod of Bermuda, we will let it go without further suggestions. The little spots that have appeared in the cultivated land should be hoed out and the grass all carefully put into sacks, for if it lies around to be driven by the wind it will start new spots. We have it gathered into sacks, hauled in and hung up in trees about the ground. After ten days it is carried to a Bermuda grass patch and burned.—M. E. Sherman.

Keep things clean. The best milk in the world, the richest cream and the best utensils cannot produce high-priced butter if a few million harmful bacteria are allowed to multiply in the filth near the house, in the sour particles in the seams of the cans, or in the corners of the utensils. Go into partnership with hot water, sunshine and pure air. Coleman's Rural.

A Man From Ohio Talks

There is 29 years of experience in this machine



It runs a horse lighter than any other

About the Success Manure Spreader

"It has been the most satisfactory piece of machinery I ever purchased. It spreads all kinds of manure better and covers more ground than can be done by hand. The narrow front trucks do away with all jerking of the tongue against the horses on rough ground. I can start a load that a team cannot shake on a wagon. I can get in and out of places that I couldn't with a wagon. It has changed the hard and much dreaded job of manure spreading into a snap. I would not do without it.—A. C. Presno, Mendon, O."

The Success is Now Completely Roller Bearing

Seven sets, one to each wheel, two on beater one on beater drive. That settles the draft problem. It is still the staunchest, best working spreader made. Send for catalog before you buy.

Kemp & Burpee Mfg. Company, Syracuse, N. Y.

Sugar-Beet-Pulp (Kow-Breakfast-Food) For Cows

Q. What is a Cow?
ANS. She is a square critter, with a peg at each corner to stand on.

The Cow Talks:

I have also been called a "milk-machine." To a nail-machine they feed wire and get nails. So they expect to feed me wire-y, dusty, musty hay and get milk. Nothing in it. Don't expect to get wire nails from a nail-machine without feeding it wire, nor milk from this milk-machine when fed on wire-y hay mostly trodden under my feet.

I'll tell you what to feed me—give me Kow-Breakfast-Food when I come in from the pasture.

Kow-Mathematics

Then I'll give you 32c worth of milk for a cent's worth of pulp. Besides, I figure I'll get fat at the rate of about a pound a day.

(Mrs.) A. Lean Cow.

P. S. You can get fresh Sugar-Beet-Pulp at 50 cents per ton from the Chute at the

Los Alamitos Sugar Factory, Los Alamitos

FLYFOE

That is just what it is. Sprayed on stock it kills or keeps off all those awful pests, flies, mosquitoes, gnats, etc. Do you realize what that means? Use it and note how much easier it is to keep your stock in condition and how comfortable they are. Sprayed on your cows the increased milk yield will many times pay for its cost. You should use something of the kind and

FLYFOE

will be found the most effective "fly bouncer" on the market.

If your dealer does not keep it, we will ship a 1-gallon can at $1.25 or a 5-gallon can for $5.00, and will prepay the freight. If not fully satisfied with it money refunded. Made by the

FARMERS' BOOKS
Order Through the Cultivator

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Hussmann of California. With contributions from well known grape growers, **giving wide** range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

Cultivator Publishing Company

STARTLING STORY OF LOSSES.

Wilbur J. Fraser, a dairy inspector in Illinois, tells the following graphic story of losses among Illinois dairy herds. The figures presented are somewhat startling but they are taken from the records and must be correct.

The conclusions are surely sound. The same general conditions will apply in all dairy communities and the facts here presented will bear close study by all dairymen, no matter where interested. As it may set dairymen to thinking, we reproduce a portion of it, together with his "deadly parallels" in illustration. "Very few dairymen," said he, "even set down the payments received for milk and the items of money paid out for the whole herd, to say nothing of the individual cow's record or estimating the cost of the feed. But this station has been investigating the matter for several years, and the actual facts are so surprising that it taxes all manner of presentation to show their bearing on the dairyman's profit.

"Included in the dairy investigations of this station are the individual records for a full year of 554 cows in 36 Illnois herds. To make a large and fair comparison take the lowest fourth and the highest fourth of all these cows. This is 278 head, or half of the entire number.

"The lowest 139 cows (one-fourth of all) yielded an average of 133½ pounds of butter fat during the year, and the highest 139 cows produced an average of 301 pounds butter fat.

"The Elgin price of butter the past five years averaged 23 cents per pound, and this is the usual price the dairyman gets for the butter fat in his milk, it costing the overrun to make the butter.

"At 23 cents per pound for butter fat the poor cows make an average return of $30.77. At the low estimate of $30 per year for feed, this would leave 77 cents profit per cow for the whole year's work and investment.

"But the best 139 cows made an average income of $69.32. Allowing these better cows $38 per year for feed ($8 better than the poor producers) the clear profit is $31.31 per cow. These calculations allow the skim milk, calf and manure to pay for the labor and interest on the investment.

"The profit from the whole 139 poor cows is only $107, but the clear money from the best 139 cows amounts to more than $4000.

"Every one of these good cows average as much clear profit as 41 cows of the poorest kind. Herds of these two kinds would have to be kept in the following comparative numbers to produce exactlly the same profit for the owner.

Good cows.	Poor cows.
1 cow equals....	40 2-3 cows
15 cows equal	612 cows
25 cows equal	1,021 cows

The student of dairying will find in these tables some things he does not realize. He will find one thing surely, viz., that it does not pay to keep a poor cow in the herd. Dairying, properly conducted, is one of the most profitable lines of farming, but the actual relation of the cow and the herd to the clear money that the owner gets out of the business is, as a rule, neither known nor suspected by the men depending upon the occupation for a living.

Sonoma County Pomona Grange recently met in Santa Rosa. One feature of the fine exhibit of fruits and berries held was Burbank's new Banana plums.

HOG CHOLERA.

In your issue of July 23 is a categorical article on hog cholera, in which you refer to the disease as "highly contagious." The writer has had much experience with the disease in the Southern States, and as known there it is not in any proper sense a contagion. It does sometimes assume a very malignant form and becomes epidemic, spreading rapidly from herd to herd and from community to community, and that, too, in many instances, without the possibility of one herd taking it from another, other than through the atmosphere. In many cases, infection or the spread of the disease by any method you suggest, is utterly impossible.

Now, can the disease be cured? You say, no. I say, yes. This is the remedy: When the first symptoms appear, separate the diseased hog or hogs from the herd and from water; also from food except in liquid form. Mix 3 or 4 table spoonfuls of concentrated lye (any brand will do) and give to the diseased hogs. They will drink the mixture, if they are allowed to have no other drink. Meanwhile, saturate the hog with black oil to kill the lice.

No trouble to cure the disease if this simple remedy is used. Care should be taken, however, not to use the lye too freely. Just enough should be used to give the drink or liquid food the color of good apple vinegar. —G. R. Harrison, Corcoran.

WATERING THE HORSE.

Much cruelty to animals is caused by many kind hearted peoples' thoughtlessness about watering the work team. On this part the Farm Progress preaches:

It is almost the universal custom among farmers I know to water their horses in the morning before going to the field to work; then again at noon and lastly on quitting work at sunset or thereabouts. I do not think this is treating the horse right.

Three times a day, in hot summer weather, probably pulling on a dead strain all the time, is not often enough for the work horse to be watered. The average man finds it necessary under such conditions to drink much oftener.

Of course it will be said by a great many that in most cases no water can be conveniently reached for the horse and it is not so easy to bring a large quantity to the field for the horse, as it is a small quantity for the man; but this is not an adequate excuse.

If the drinking place is not far away it will be easily possible to unhitch the horse from plow or cultivator and ride or lead him at 10 o'clock and again at 4 to the watering place and let him drink. But if it is objected that it will cause the loss of too much time, the difficulty can be obviated by taking water to the field.

Every farmer ought to have a barrel made fast on a sled, so one horse could pull it, and this should be filled or partly filled and taken to the field. Then when the man got thirsty enough to drink he could let the horse have some water, too.

I am advocating this, not only because it is humane, but because it is better for the horse not to go too long without water, and then when very hot fairly flood himself with water. Horses are sometimes given severe colic by this treatment and may be otherwise injured.

But the humane plea is sufficient. It is worth while to stop and lose a little time, just to know that you are contributing to the comfort of a good servant.

Another point in this connection is that horses kindly treated in every way will be able to do more work in a year and will retain their ability to do good work for a longer time. I have always noticed that the men who had the best horses, horses that could do more and better work than those of others, were thte men who habitually treated them with most consideration.

I have found it to be a good practice to set a bucket of water handy for the horse when he is stabled for the night so he may drink if he wishes. I have generally found that they drank at night.

FLY REPELLANTS.

Those who use fly repellants should not expect them to be the means of increasing the flow of milk. It is claimed on some of the advertising circulars, setting forth the merits of the repellants, that the cow's flow of milk will be increased from 20 to 50 per cent.

We have collected data from the different stations and find that while the majority of the repellants are effective in keeping the flies away from the cows, they have no influence on the amount of milk given or on the amount of butter fat the milk contains.

While it is true that the cow shows a marked decrease in the flow of milk during "fly time," the cause lies in the fact that the hot weather has cut the pasture short and the animal suffers from a lack of feed rather than from the presence of flies. If the cow is given an additional supply of feed, such as green corn, oats, hay, green cut alfalfa or a number of other supplemental feeds during the hot months, there is no noticeable decrease in the amount of milk. It is a good plan to use the repellants for the comfort of the cow, but it is a better idea to see to it that she has all the feed she can eat at all times during the dry weather.

NEVER DRENCH CATTLE.

Perhaps the best way of demonstrating the danger of drenching cattle is to advise the reader to throw back his head as far as possible and attempt to swallow. This you will find to be a difficult task and you will find it more difficult and almost impossible to swallow with the mouth open. It is for this reason that drenching cattle is a dangerous practice. If a cow's head be raised as high as possible and her mouth kept open by the drenching bottle or horn, a portion of the liquid is very apt to pass down the windpipe into the lungs, sometimes causing instant death by smothering, at other times causing death to follow in a few days from congestion or inflammation of the lungs.

Give all cattle their medicine hypodermically or in feed; if they refuse feed give it dry on the tongue.

The proper method of giving a cow medicine is to stand on the right side of the cow, placing the right arm around the nose, and at the same time opening the mouth, and with a spoon in the right hand place the medicine, which should be in a powdered form, back on the tongue; she can then swallow with safety.—By Dr. David Roberts, Wisconsin State Veterinarian.

Green fruit shipments are nearly doubled this year over those of last.

CARE OF HORSES WITH HEAVES.

The following information given by a careful horse owner may be found useful by those who own horses affected with heaves:

A horse with heaves can seldom be sold or traded advantageously, and having a good mare come into my hands once that I found had a touch of heaves I did not try to get rid of her, but treated her so that for ordinary uses she was one of the most valuable animals on the farm. She was watered always before feeding, fed only clean, bright grain and hay, the latter always lightly sprinkled but not made wet, and when she showed signs of coughing a little oil of tar, perhaps a tablespoon, in her feed twice a day, eased that off at once, so that she was never allowed to cough. She was a good roadster—the women folks wouldn't drive any other horse—a willing worker, intelligent and gentle, and besides six or eight years of good service on the farm and road, she raised three fine colts before the disease finally carried her off. But she was kept in good condition only by good care, and consideration when working her—she was never overworked nor overdriven, allowed to take pretty much her own pace on the road. But it pays to treat every horse right.

COLLAR BOILS.

When horses are put into hard work in the spring, collar boils and other festering sores are liable to form on the shoulders. Such troubles are more frequent with young horses than with old ones which have been worked through the winter.

The first thing necessary is absolute rest. The trouble cannot be successfully treated when the horse has to work, even a part of the time. Wash the sore with warm water once each day. These washings should not be too long, just enough to remove the pus which may have formed since the former washing, but not hard enough to remove the healthy scab which may be forming. In case there is pus forming under the scab or a layer of the skin, the formation should be lanced to allow the pus to escape. This sore should be kept open and allowed to heal from the bottom.

After the affected part has been washed as above suggested, put one ounce of sulphate of zinc and three drams of tannic acid in a quart of water and apply this to the sore.

PASTURE FOR YOUNG PIGS.

There is in the life of a pig a time for growing and a time for fattening. The time for growing is when he is young; at that time he should be given foods that will put bone and muscle into him. To supply such foods at small cost is a problem that confronts every hog grower. Milk, bran, shorts and oil cake are all good growing foods, but they are more expensive and no more efficient when fed alone than when fed in conjunction with pasture crops. The pasture crop can be produced at small cost, and when it is used less of the higher priced feeds is required. It is figured that an acre of good pasture is equivalent to a ton of shorts, and it is certainly infinitely cheaper. An old, somewhat tough pasture does fairly well for sows, but it does not answer the purpose at all for pigs. They must have a young and very tender crop on which to feed. Alfalfa is the feed for young pigs in California and it can be grown so as to save a part of the crop and still furnish forage for the little pigs.

FEED WEANED PIGS OFTEN.

"One of the causes of failure to secure good results in feeding little pigs that have just been weaned," says a writer in Stock Field and Farm, "is because they are not fed often enough."

It must be remembered that when the pigs were little and nursing, they are every one or two hours; even when they were being weaned they ate every 4 or 5 hours. To begin feeding them after they are weaned only twice a day, as many farmers do, is too big a change for them. They eat too much at one time, and their stomachs are empty for too long a period. Smaller quantities fed more often is much better for the pigs. They should be fed three times a day, and better four, for a few weeks. This does not mean that in amount of feed they are to be given an extra meal, but rather that their ration is to be divided into three parts to be given at three different times.

BRANDING STOCK IN ARIZONA.

REMEDY FOR CALF SCOURS.

Professor Shaw, of the Michigan Agricultural College, says concerning the treatment of scours in calves:

"One of the best things we have used and are using almost altogether with which to suppress outbreaks of calf scours, is a mixture of tincture of rhubarb, camphor and opiate, equal parts in hot water, about a teaspoonful. One of the most interesting recoveries I have ever seen was about three weeks ago in the case of a calf that scoured and was so near death the feet were stretched out cold and stiff, and there was every symptom of death. The calf was treated in that way twice, then was fed with raw eggs and milk occasionally, and he recovered. He was the sickest calf I ever saw; so sick his hair all came off after a week or ten days, but he is one of the best feeders we have in the bunch today."

TO REMOVE WARTS.

To remove warts from cow's udder or teats try the following application, applying it twice daily: Chloral hydrate 6 grams, acetic acid 6 grams, salcitic acid 4 grams, spirits of ether 3 grams, collodin 16 grams.

Hubbard, Oregon, farmers have a cooperative creamery with a capacity of a ton of butter a week.

PUFFS ON HORSES' LEGS.

Many of the puffs which form on the hock joints of the horse may be quickly removed if the treatment is applied soon after the trouble appears. During the day a thoroughpin truss should be placed on the leg and each evening the following mixture should be applied to the affected part: Tincture of iodine, two parts and vaseline, one part. In case the joint becomes sore, stop using the mixture till the soreness has healed. If taken in time, the trouble can be corrected without causing lameness.

Salting butter is essential principally for the flavor or relish which it gives. The amount of salt depends upon the taste of the consumer and varies considerably. If the butter has much water incorporated in it more salt should be added, for considerable will be removed with the brine. Butter with small granules requires more salt than when larger, for the surface of every granule is covered with a thin film of water. Since the total surface of small granules is greater than that of large ones the amount of water retained on them is greater, so more salt will be washed out. The salt should be dry and quite uniform so as to readily and completely dissolve. If some of the salt dissolves slowly the strong brine at this particular point may produce streaked or mottled butter.—Denver Field and Farm.

Clean milking is not only advisable but necessary to profitable success in dairying. Any amount of milk left in the udder not only tends to dry off the animal but is practically lost. Every ounce of milk that can possibly be obtained should be drawn at each milking, either by the old method of stripping or the newer one of manipulation which is now commonly in vogue. Manipulation of the udder of young heifers greatly assists in the development of their milk veins and finally in an increased production of milk. It seems reasonable to believe then that the manipulation of the udder during lactation will increase the secretion of milk and add much to the total yield.

Farmers everywhere are just beginning to recognize the great value of barley for feeding cattle and hogs. Crushed barley with clover hay has shown remarkable gains in fattening cattle, and no hog raiser can afford to do without barley.

MORE MILK—MORE MEAT

IF YOU USE LILLY'S BEST FLY KILLER

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 142, 143.

DIRECTING UNFORTUNATE FARMERS.

An Ohio farmer who had for over twenty years struggled along with the mortgage on his place constantly growing larger, wrote to the Departmeut of Agriculture stating his case, condition of soil and crop for which his farm was adapted, and asked the question as to whether his case was a hopeless one or whether it might be possible to make an honest living and ever to escape from the load of debt continually over him. The Department took up the matter, investigated the case and laid out for the farmer a plan of procedure which, it is said, the farmer followed to the letter for one year. It resulted in a net profit for that first year's operation of slightly over $2000 from the 80-acre farm.

The newspaper report of this experiment, which we assume is correct, says that this little 80-acre farm will in time be made to yield a $5000 annual profit. Now, how true this may be, or how much absolute truth there may be in the entire story, we are not qualified to judge; but there is sufficient in it to suggest a great field of usefulness for the Department. There are a vast number of failures in farming operations, many of which are not because of laziness, shiftlessness, or lack of effort on the part of the willing farmer, but more because of lack of grasp of conditions and business management. This is not especially to the discredit of the farming class, because the same is true of business life, where it is claimed only 3 per cent. of business men are a complete success. Now, if the Department can establish a bureau which will have to do with this question of advice or first aid to the farmer, it is possible a new era will open for many a farmer who has failed in the past to secure proper returns from his labor.

NEW WALNUT BLEACH.

The walnut growers of Southern California believe they have the most successful method of bleaching walnuts which will be an infringement on no patent and be much more successful than any process now in existeuce. It consists in a word of a four per cent solution of common salt treated in some way by an electrical current which frees the chlorine in the solution and makes a bleach which has proved fully as successful as was ever the old chloride of lime bleach. We have seen samples of nuts treated by the process and they have a most satisfactory appearance, and it is said there is no injury whatever to the quality of the nut.

If this new process proves as satisfactory as now appears it will probably take the edge off the lawsuit which has been dragging through the courts for the last two or three years, in which the patents on the old chloride of lime process are the principal factors.

A NEW FRUIT.

A fruit which has not been heretofore grown in California is now being produced by John S. Dore of Fresno. It is a fruit which we have all eaten, but usually in a very unsatisfactory condition owing to the amount of dirt and small stones which it contained. We refer to the Zante currant. The vines or bushes on which this fruit is grown have been in Mr. Dore's possession for some time, but this is the first year in which they have ever given a crop of any amount. It is reported that Mr. Dore regards the fruit as of sufficient promise that he will attempt the reproduction of as many vines as possible from those which he now has. The fruit is about the size of the Thompson Seedless Grape, of fine flavor and excellent shipping qualities. Each bush or vine will produce from 10 to 40 pounds of fruit.

A NEW LABOR SAVER.

Considerable interest is being manifested in the hop bearing sections of the Sacramento valley and the North Coast counties in the new labor saver in the form of a hop picking machine. This machine is the invention of a Mr. Horst of Wheatland. And if the reports of the local newspapers are to be credited the machine is indeed a wonderful mechanism. One paper speaks of it as being almost human in its method of picking the hops from the vine. It says: "The hops are picked very clean and in a manner far superior to hand work."

COMING ORANGE CROP.

No one has any very definite prediction to make concerning the coming orange crop, but sure it is that the drop during the past few weeks has been very heavy. The exceedingly warm weather has caught some orchards with insufficient moisture which has caused the heavy drop. Besides that there is always liable to be a heavy June and July drop which cannot be prevented by any known method. The inventor who can inform our orange growers how to prevent this dropping of fruit will win everlastiug renown as well as many good dollars.

It is said that Theodore Roosevelt is the only president who has urged the farmers of this country to organize and protect themselves. Be that as it may, it is surely advice which may well be taken by our farmers, for if there were ever a period of our history in which the necessity seemed to be before us to secure protection against the greed of organized capital, it is at the present time. Only recently we had in an issue of this paper a communication which ends with the question: "What can be done to save ourselves and secure in the markets a just return for our labor?" It is a wise man who can give the answer to such a query, and it is well worth discussion in our clubs, granges and in the newspapers.

"Any fool can destroy trees. They cannot run away and if they could they would still be destroyed—chased and hunted down as long as fun or a dollar could be gotten out of their bark, hides, branching horns, or magnificent bole backbones. Few who fell trees plant them. Nor would planting avail much toward getting back anything like the noble primeval forests. During a man's life only saplings can be grown in the place of the old trees, tens of centuries old, that have been destroyed. It took more than 3000 years to make some of the trees in our western woods—trees that are still standing in perfect strength and beauty, waving and singing in the mighty forests. God has cared for these trees, saved them from drouth, disease, avalanches and a thousand straining, leveling tempests and floods, but he cannot save them from fools.—John Muir.

One of the recent claims of scientists is that if sugar is supplied plentifully an appetite for alcohol will not be created. Farm life affords many luxuries improved by the liberal use of sugar; and if its use will curb the craving for alcohol, the fact should be kept at the front. Anyway, sugar is cheaper and more wholesome than meat, and if, as is claimed, the taste depraved by alcohol spurns it, the chance of preventing other tastes from becoming so perverted is worth the trial.—American Farm World.

The average condition of winter wheat at time of harvest was 80.6, as compared with 86.0 on June 1, 78.3 at harvest, 1907, 85.6 in 1906, and 80.2, the average at time of harvest for the past ten years. The average condition on July 1 of spring aud winter wheat combined was 83.9 as compared with 89.4 last month, 81.6 on July 1, 1907, 87.8 on July 1, 1906, and 82.9 the ten-year average.

Mr. Frank M. Meyer who has recently returned from a tour in the interior of China in search of plants which may be of value in this country, has returned with a large number of plants heretofore unknown in this country which will be planted and tested at the introduction gardens at Chico.

The amount of wheat remaining on farms on July 1 is estimated at 5.3 per cent of last year's crop, equivalent to 33,797,000 bushels, as compared with 54,853,000 on July, 1907, and 42,012,000, the average for the past ten years of the amount on farms on July 1.

Shop Talk

CANDY BOOK.—Many readers this warm weather are thinking of ice cream and how to keep cool. This book which we are sending as a premium for subscriptions, contains recipes for both ice cream and candy which are certainly fine. Over 300 formulas. Look up the ad in this or next week's paper. Remember it is only necessary to remit enough on subscription to pay an entire year in advance and request the book at the time the money is sent .

FARMERS'. BOOKS.—Under this heading we have recently advertised several books of value to ranchers, but in one case an error was made in the price. "Feeds and Feeding" by W. A. Henry was priced at $1.00, which should have been $2.00, and is certainly very reasonable at the latter price. The list appears again this week and any of these or any others not mentioned we will be glad to obtain for our readers.

C. W. Uplanke, Dinuba, says: "I know of no other investment which would pay such frequent and valuable dividends as the Cultivator pays."

D. G. Aplin of Imperial, president of Imperial Water Co. No. 1 says: "The Cultivator is a fine paper and a great help to all farmers and those interested in agricultural pursuits."

"Am much pleased with the Cultivator. We consider it the California farmers' best friend, and its weekly visit is welcomed by the entire family."—J. B. Simms, Dos Palos.

"Your paper is invaluable to any progressive man interested iu agriculture."—Stuart Walcott, Carpenteria.

Agricultural Notes of the Pacific Coast

Northern California

Tehama county will exhibit at the State fair.

As a rule the entire valley has a very poor crop of wheat.

Sacramento valley melon crop is short of the usual output.

Harvest of sugar beets began in the upper Sacramento valley last week.

Sonoma county wine grapes are looking well and a big crop is promised.

Pear shipping has been begun by the Pioneer Fruit Company at Red Bluff.

The sugar factory at Hamilton City will handle about 800 tons of sugar beets daily.

Potatoes are being bought in the upper Sacramento valley at 75 cents per hundred.

Cutting of alfalfa in the Klamath Basin is short in yield but the better price compensates.

Acampo has two-year-old Tokay vines which are bearing a small crop of grapes this year.

Development Association of Colusa, Colusa county, is taking steps for an improved system of roadways.

The first sample of beets tested from near Davis ran from 12 to 19 per cent sugar and 77 to 83 purity.

Healdsburg cannery started last Monday on Crawford peaches. Several hundred hands will be employed.

Preparations are under way at the State Farm for the short courses in agriculture, which will begin October 12th.

Fig growers of the Sacramento valley claim that they are now producing some of the finest figs produced in the world.

Pomona grange of Sonoma county is adopting resolutions denouncing secret legislation caucuses of political parties.

The "good luck county," which is a synonym for Colusa county, has secured a recent colony of several well-to-do families from Ohio.

The California Fruit Canners' Association cannery at Santa Rosa is handling large quantities of plums, peaches and blackberries.

The Protective Organization of Wine Growers has decided to send lecturers through the country preaching the gospel of the grape and temperate use of wine.

Red Bluff, Tehama county, reports the experiment in picking hops by machine as a complete success, over 250 acres having been picked by it this season.

The apricot harvest all over the Sacramento valley has been very large, but as a rule has been very unprofitable, owing to low prices. Some fruit has not been harvested.

Under the direction of Prof. Fortier irrigation investigations are being conducted near Gridley, Butte county. Many ditches are being investigated and measurements made as to the water flowing.

Large numbers of pickers are flocking into the hop fields near Wheatlands and it is feared that the supply of laborers will exceed the needs. The season will not be in full swing until about the tenth of August.

Central California

Turlock is making a hot campaign against Johnson grass.

Lodi will make a large exhibit at the coming State fair.

Santa Cruz output of hops will be much less than formerly.

Turlock is now shipping out about a car a day of cantaloupes.

Tulare county is petitioning for a bond election for good roads.

California is the largest honey shipper of any State in the Union.

California Canneries Company, at Tulare, is in full swing on canning peaches.

The evaporation of Tulare Lake has almost accomplished its entire drying up.

Thrips are visiting the orange orchards of Tulare county and doing some damage.

Porterville is planning the immediate construction of a new orange-packing-house.

Some sections of the San Joaquin Valley report the apparent disappearance of pear blight.

Slight increase in the quotation of dried apricots to 6¾ cents is very satisfactory to growers.

Thunder showers visited the mountains along the eastern side of San Joaquin valley last week.

The annual run of apricots by the Santa Clara Valley canneries was the greatest in their history.

A carload of Thompson Seedless was shipped from Sanger July 25. This was its first full car shipment.

The end of July witnessed one of the greatest forest fires that has ever occurrred in the Monterey forest.

No agreement has yet been made between the Coast Dried Fruit Dealers and the New York Association.

Already some contracts have been made by which the table grapes from several vineyards at Lodi have been sold.

Tulare County Fair Association will present a silver championship cup to the first-prize cow exhibited at its fall fair.

A woman at Los Gatos has gone East to purchase a bunch of Arabian horses with which to stock her breeding farm.

A forest fire in the mountains back of Porterville destroyed the flume of the Mount Whitney Power Company last week.

Fresno county watermelons have been greatly reduced in output by prevalence of blight which has done vast injury.

An extensive water suit of much interest to water owners along the Tula River is about to be taken up in Tulare county.

The Horticultural Commissioner of Santa Cruz reports that the fruit prospects of the Pajaro Valley were never better than this season.

National forests of California aggregate about 22,878,753 acres of which the Sierra Forest is the largest with over 5,000,000 acres.

A large tract of land near Pixley, Tulare county, has been sold to an eastern syndicate to be planted entirely to eucalyptus trees.

Southern California

Ventura county proposes to take up a campaign for good roads.

Ventura county's output of dried apricots will be about 1500 tons.

The last car of Imperial valley cantaloupes was shipped Thursday, July 23.

The Fullerton Vegetable Union has about 300 acres of sweet potatoes planted.

Warm weather the last couple of weeks has caused the dropping of many oranges.

W. B. Parrott is president and L. B. Stewart secretary of the Fullerton Vegetable Union.

The apricot crop about San Bernardino this year aggregated about 1000 tons of fruit.

The Chino sugar factory is now in full swing with its 1908 campaign, having started July 25.

Imperial valley hogs are bringing money into the valley at the rate of about $1100 per carload.

Coachella valley hopes to market 10 cars of grapes before northern grapes are in the market.

Fruit growers of Ventura county are inaugurating an active campaign against red and purple scale.

Imperial grape growers will make their muscats into raisins this year more largely than ever before.

An effort will be made next year to limit the acreage of melons of the Imperial valley to 3500 acres.

Orange county is to hold a products carnival and three-day celebration to show the wonderful output of their county.

The directors of the various water companies in the Imperial valley recently met to discuss the question of water rates.

Secretary Pease of the San Bernardino Horticultural Commission is urging a stronger fight against the scale of that county.

Santa Paula, Ventura county, fruit men have had trouble with their Jap workers and many Russians have been introduced to take up their work.

An effort is being made by Orange county irrigators to do extensive reforesting of the Cleveland National Forest during the coming season.

Prof. H. J. Quayle of the State University is now established at Whittier where he will make a study of entomological questions of Southern California.

Los Angeles county voted on Thursday on the question of bonding the county for $3,500,000 for good roads which was carried by a very large majority.

Serious mountain fires near San Bernardino have shown that the "fire trails" or breaks have not been as effective in controlling the spread of the fire as was hoped.

A Los Angeles experimenter claims he has an instrument which will measure moisture contained in the soil and indicate the necessity or otherwise of irrigation.

E. J. Levengood of Orange county has filed a complaint for $400 for cattle destroyed in dipping for Texas tick which was under the supervision of the county veterinarian.

The Coast

Winter wheat near Garfield, Wash., will run about 45 bushels per acre.

Cottage Grove, Ore., has recently erected an immense fruit evaporator.

Late rains have made a success of the dry-land crops near Baker City, Ore.

July closed with a fearful electrical storm over the eastern part of Washington.

Baker City, Oregon, is becoming one of the greatest wool centers of the northwest.

Grasshoppers are infesting the alfalfa fields and doing vast damage at Pendleton, Ore.

One Yakima Valley farmer is shipping honey at the rate of about ten carloads for the season.

Oregon ranchers say they have been buncoed out of thousands of dollars in the recent wool sales.

Sandpoint, Idaho, claims to have timothy hay seven feet high with heads measuring ten inches.

Spokane, Wash., has a pest in the form of a worm infesting cabbages, very similar to codling moth.

Pullman, Wash., is suffering from a plague of English sparrows, which has become almost unbearable.

Grain fields about Walla Walla were destroyed by fire which was set by lightning during the recent storms.

Apricot growers near Wenatchee, Wash., received from $17 to $20 per green ton for their fruit this season.

North Yakima fruit growers have organized the Yakima Valley Fruit Shippers' Association, J. M. Perry, president.

There are 4000 varieties of wheat, oats and barley in the experimental plats of the State College at Pullman, Wash.

The management of the apple show to be held in Spokane in December is adding new names to the already large list.

Idaho was recently visited by a hail storm which was so severe that tin roofs were punctured by the large hail stones.

The Experiment Station at the State College at Pullman, Wash., is making a campaign for selection of better seed potatoes.

Cherry growers at Salem, Ore., have found their immense crop of cherries too large to move green, so that many will be dried.

Apple orchards about Oregon City, Ore., are badly infected with the disease of scab. San José scale is also very prevalent.

The grain growers of Eastern Oregon find themselves agreeably surprised at the crop which is much larger than anticipated.

Immense importations of California apricots into Portland caused serious slump in the market and local fruit went begging at any price.

The cherry orchards adjacent to the Dalles have given a thorough test of the arid farming plan of soil culture and report wonderful results.

Pendleton, Oregon, reports an exceedingly fine quality of wheat and large quantities. One report says that every bushel so far thrashed has graded number one.

PER 2 BUSHEL SACK **$1.90** PER 2 BUSHEL SACK

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Coulson's Cresolene

**LICE KILLER
DISINFECTANT
AND DIP**

Dilute With Water Before Using

CRESOLENE is a powerful disinfectant, insecticide, and germicide obtained from coal tar. It is non-poisonous, and non-corrosive and will do no harm to the most delicate skin.

It mixes readily with water, forming a milky emulsion, and can be diluted from 50 to 100 times its own bulk, in accordance with the different uses to which it is put.

Thus when you purchase 1 gallon of CRESOLENE you can make up to 100 gallons of the best disinfectant for use with stock, poultry, dogs or as a general disinfectant and insecticide.

This reduces the cost to 1 1-4 cents per gallon which is cheaper than anything else on the market.

PRICES: Quart can, 50c; one-half gallon, 85c; gallon, $1.25.
Freight paid on orders of one gallon or more.
Manufactured by

Coulson Poultry and Stock Food Company
Petaluma, California
Germain Seed Co., Los Angeles, Distributing Agents for So. Cal.

Little Chicks should be fed on **Excelsior Chick Food**

prepared from clean, sound grains, seeds, beef scraps and charcoal in proportions to make a well balanced ration and produce strong, healthy chicks and keep them continually growing. For sale by all dealers and grocers. Take no other.

Excelsior Cereal Milling Company

242 Central Ave., Los Angeles

MY BOSS MAKES MONEY

Because he raises poultry in the Inglewood Poultry Colony. Eggs bring a higher price there than they do anywhere else. If you are going into the poultry business, go in right and get a farm in the Inglewood Poultry Colony. Address for particulars

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

REMARKABLE POULTRY PROFITS.

THE query often comes to the Poultry Department: Can a man make a living off poultry in California? These inquiries more frequently come from people outside the State who wish to come to California, but must have some means of making a living. The following article recounts the experience of one man who has made a success and while there are many points of value to the would-be poultryman, I would advise no one to go into the poultry business with the expectation of being as successful as Mr. Ruport's venture has proven.

We should continually bear in mind that success is largely influenced by the choice of location. The factors—market, climate and cost of food being important points to bear in mind when selecting a location.

This is strongly brought out in Mr. Ruport's experience. He is able to feed a hen a year for 96 cents. In many localities in California it would cost $1.25 to $1.40 to feed the same hen. Again, his average price per dozen for eggs is 30 cents. At many points the average price would be considerably less unless as large a percentage of the yield is obtained during the late fall and winter months. His yield per hen, 140 eggs, is far in excess of the average yield of large flocks in this State. There are many plants in this State where the average yield per hen is well under 100 eggs; and his gross receipts per hen of $3.60 is far in excess of the average returns.

On figuring your possible returns bear all these things in mind. One feature to be especially commended in Mr. Ruport's practice is the use made of kale. Under his management it is made to yield large quantities of green food at a minimum cost.

The following by Mr. H. B. Mattews, our traveling representative, gives results on the ranch of Mr. John Ruport at Eureka:

Mr. Ruport was a locomotive engineer for 28 years up until 4 years ago when he left the railroad to take up his present work.

He has a nice home upon a two-acre tract. His house and back yard take up about one-fourth of an acre and balance of two acres is devoted to garden for raising green feed for chickens, chicken runs, brooder houses and incubator house; also houses for the laying hens. His brooder house is 12x30 feet and other houses are nearly the same size. All houses consolidated would make a house 12x300 feet. He has 12 incubators, incubator house and 16 brooders in the brooder houses. He keeps from 800 to 1000 eggs in his incubators all the time and raises to maturity from 65 to 70 per cent of the chickens that are hatched.

In the months of February, March and April he runs 1000 eggs per month and the months from May 1st to Oct. 1st he will run 800 eggs per month. He had 1500 birds up until January last when he sold off enough to reduce his stock to 450 hens. He keeps no hen older than two years. From the 450 hens he is getting enough eggs to have 800 to 1000 for hatching and supply the stores with seven dozen each month besides. From the hatching of 800 eggs a month he raises at least 200 chickens for 4-months-old fryers and enough chickens besides to raise his number of hens from 450 to 1500 by January 1st, 1909. At the present time, he has 1800 birds of various ages, part for fryers, part raising for increase of stock and then the 450 hens.

Mr. Ruport grows kale in the rear of each chicken yard, making the rows 14 inches wide and planting the kale 14 inches apart. His runs are 50x100 feet and he keeps 100 birds to the run. He plants enough kale so that there are two plants for each chicken. He claims that two plants of kale will give a chicken all the green food it needs through the year and that it saves 40 per cent upon the food bill of the chicken. The kale grows the year through in Eureka. He plants a new crop each year and fences chickens off from it while it is growing first week or two; after that chickens can not kill it out. A chicken has to be six weeks old before he lets it eat kale.

In Eureka lumber is cheaper than in most places. Mr. Ruport paid $7.00 per thousand feet; it cost him 50 cents worth of nails for each thousand feet of lumber and $1.00 for hauling each 1000 feet; counting labor, it cost him $800 to build his houses; $1500 would cover the total cost of chicken wire and posts of fences, houses, brooders and 12 Jubilee incubators and whatever else was in his chicken plant.

His food bill per chicken one-year-for grain, cornmeal and grit was 96 cents for the year of 1908. On a test of 150 hens last year he received a few hundred over 21,000 eggs, which sold on the average of 30 cents per dozen, which brought him in an income of $3.60 per hen. Each hen was 12 months old when it started in. He sells 200 fryers per month at 50 cents average per piece which cost him about 25 cents each to raise. So far this year he has sold 7000 eggs for setting at 50 and 75 cents per setting, and 500 incubator chicks at at 10 cents a piece.

He cleans all houses each day and goes over them once a week with coal oil. In this way he has no vermin and chickens are always healthy. He does nothing but devote his whole time to his chickens; he is with them from 6 a.m. to 7 p.m.; between those hours he has time to spend with his gardens and do some other work he might wish to do about the house.

His chickens are White Leghorns and he finds that they will do as well through the summer months as they do in the winter months, which he claims is due to the cool, even temperature of Eureka.

Ground outside of that taken up by chicken runs and houses, he has devoted to vegetable gardens from which he raises enough vegetables to supply his table wants and much besides for his chickens.

In Eureka, irrigation is not known; the fogs and rains keep the ground always moist.

From Mr. Ruport's results others might gain an idea what they could do in raising chicks in Eureka. Mr. Ruport believes this country to be the natural home of chickens on account of its evenness of climate.

POULTRY BREVITIES.

Good brooding cannot save poorly incubated chicks.

* * *

A strong chick is easy to raise. A weak one is a difficut matter.

* * *

Chickens should not be fed for 24 to 36 hours after they are hatched.

* * *

Charcoal is valuable as a preventive or corrective of digestive troubles.

* * *

Two extremes to avoid in poultry management are overfeeding and underfeeding.

* * *

Do not allow chickens and old fowls to roost together, as it tends to stunt the growth of the young birds.

* * *

The chick should from the day it leaves the shell until full growth is reached be made to gain in weight.

* * *

It costs more to feed a Wyandotte than to feed a Leghorn. The Wyandotte sells for more when disposed of.

* * *

Avoid above everything giving small chickens sticky or sloppy food, and do not give more than they will eat up clean at a time.

* * *

Young turkeys are very stupid at first and a good plan is to place two or three hen's eggs with turkey eggs a week after the latter have been started. The chickens will teach the young turkeys to pick up their food.

* * *

Indigestion.

Mrs. F. L. W., Baldwin Park, says she hatched out thirty little ducks and they all lived for two weeks, apparently well. She noticed nothing wrong until they would suddenly throw back their necks and die within a few minutes. She fed them corn meal and bran, the same feed she gave her ducks last year and they did well. Can you tell what was the matter with them. She says it may have been limber-neck, although she does not believe it was.

I am unable to say what was the matter with these ducks, but am inclined to believe that it is due to indigestion, and it would be well to try a change of food.—S. S. T.

* * *

Tuberculosis.

Can you tell me what is the matter with our hens. We have a flock of 25 Leghorns; they have a tight house in which there are no drafts and the run of a yard 20 by 60 feet. We have lost several in the last three months. On examining the dead birds they appeared very poor, although we have fed liberally, and on opening them the livers were covered with white spots. Sometimes a hen will be lame and one has a bunch on the foot, which, on being opened, contained a white cheesy matter. Any light you can throw on the subject will be appreciated.—H. K. I.

I suspect your birds are infected with tuberculosis. This is a contagious disease of poultry affecting young and old stock. The causes are due to infection from other tubercular fowls or from other animals suffering from this disease. It may be conveyed to hens by drinking milk of cows that are suffering from the disease. Consumptive people may be the cause of the infection at times by the hens eating the matter coughed up by patients suffering from this trouble. All conditions of filth, darkness and bad hygiene, are predisposing causes.

The only effective treatment is preventive; when a bird is suspected, it should be killed and the carcass burned. Sunshine and good air are among the best means of prevention. Direct sunlight is a great germ destroyer. Kill all suspected cases; thoroughly disinfect the house. Provide good ventilation in the house, by cutting openings and tack muslin over the openings. I think it advisable for you to get rid of all the birds on the place and let the house and yard remain vacant for six months or more. If new birds are brought on the place confine them in a new location. This disease is some times known as "going light" and is similar to tuberculosis in man. It is tuberculosis in the fowl. This disease is very common among the dairy cows of the State and may be transmitted to the hens by milk from such cows.—S. S. T.

PRACTICAL POULTRY POINTERS.

I know of a large poultry farm in the East where every bit of grain is boiled that is fed. I like to feed boiled grain, and the fowls enjoy it, too, says a writer in Commercial Poultry. I believe it takes less grain where it is boiled than when it is fed in the raw state. But where chickens eat much boiled grain they need plenty of grit. Wheat and cracked corn require a little cooking, but if boiling water is poured over the oats by the time they are cold enough to eat it will be sufficiently soft for feeding. Young chickens grow fine on boiled wheat.

Until chicks are a month old or so they should be fed a little, but often. Do not overfeed. Young chicks require but a little at a time.

It should never be forgotten that poultry need some kind of green food at all seasons of the year. In winter they can be given cabbage, onions, turnips, etc. Economy in preparing and in the distribution of the food is a matter that deserves the most earnest consideration of poultrymen.

When the combs and wattles of the fowls are of a bright red color it indicates a healthy condition.

Infertile eggs taken from the incubator need not be thrown away. They can be boiled and fed to the little chicks.

Poultry seldom have too much sun, but rather are too often kept in such dark places that they become unhealthy and unprofitable.

Every little detail tells in the result desired, and success in poultry raising depends almost entirely on attention to the smaller details.

A good, large coop into which young chicks can easily go at feeding time is a necessity of the poultry yard. Covered with a woven wire over a stout frame, food can be thrown into it easily. With an opening at the ground large enough for the young ones to go in and partake of their food in peace, such a coop is a real protection. Where old and young are fed together, the young ones are run over and deprived of their rights.

The annual visitation of mites that commonly begins with warm weather in the spring may be prevented by keeping the poultry house clean and spraying the house with a good lice killer. A spray pump saves its cost several times over every year. Nine-tenths of the so-called poultry diseases are caused by lice and mites. They sap the very vitality out of the chicks. It is lice, and not disease, that is eating away their strength and vitality. Of course if the lice are permitted to infest the chickens, it will not be long till disease will get a foothold, but this is usually caused by the lice so weakening the condition of the birds that it becomes an easy matter for them to fall victim to the first disease which breaks out in the flock. In caring for the sick

Malthoid Roofing

R. P. Grant, a baker of Visalia, Cal., U. S. A., writes: "During the time I have used Malthoid Roofing, my bakery has been damaged by fire on four occasions, which was communicated from the outside. In none did the fire reach the interior through the roofing, although subjected to terrific heat. Through Malthoid's efficiency as a fire protector, I have saved many thousands of dollars."

fowls, it is a safe rule to first look for lice upon the fowls. It is a good idea to treat for lice while you are treating for other diseases.

Cockerels are usually very docile and gentle in their growing period if kept in lots by themselves and where no pullets are permitted to run, still there is a certain stately development noticeable when the females are permitted to associate with growing cockerels. It is better for all concerned that these females be mature hens than immature pullets.

Chickens hatched in an incubator can be reared either with hens or with a brooder. Some people are able to make good hatches with their incubators, but they are unable to rear the chickens in a brooder. In this case I would advise the use of broody hens for mothers. Some people do not care to invest in a brooder.

If the brooder can be placed in a small portable house, it is a good plan, as it is thus protected from stormy, cold winds in the early spring, also from the heat later on. The house protects the chicks from rain and serves as a roosting coop after they become too large to stay in the brooder.

The best time to sell is when the market is ready and the fowls just right. Never wait for a chick to mature; the largest profit is from the early hatched ones. The earlier they are hatched the better, as the early chicks are luxuries. The sooner they are marketed more food will be saved. In many sections a large proportion of the poultry is marketed during the periods of Thanksgiving and Christmas, but the supply is almost invariably far in excess of the demand, and unless the poultry is fat and choice, the best prices are not obtainable. The regular market price at this time of the year is usually low and the result is much stock is held over at a loss. I have sold broilers at $1.05 each early in the season. Had I kept them until fall I would only have received thirty or forty cents each, and besides all of the care and feed until then would have been lost.

The good poultryman, like the man who is good at anything else, is never satisfied with present attainments. He is not satisfied to have the flock of this year no better in quality and no more profitable than the flock of last year. There is no farm flock, nor any other flock, in which there is not room for improvement. The quality of the poultry in this country is improving very rapidly. The improvement seen in the poultry shows during the last five years is nothing less than astonishing. Is this true of your flock, or are you content to go along year after year in the old rut?

BROWN AND WHITE EGGS.

It is a curious fallacy that the brown colored egg is necessarily superior to the ordinary white egg, a belief which has led to the practice of artificially doctoring the latter in imitation of the former. It is doubtful whether the color of the shell bears any relationship to the nourishing quality of the egg. As those who rear poultry know, it is merely an indication of the strain of the laying bird. Still, a preference is very commonly shown for the brown or coffee-colored egg; the color is attractive and, led by the eye, the choice is very generally made in favor of what is regarded as the richer and superior article. The practice of deception is thus encouraged. The shell of the white egg is stained in the simplest possible way, perhaps by immersion in a decoction of coffee berries or by means of an aniline dye. This resource may satisfy the eye, but, after all, there is probably not the slightest difference from the nutritive point of view between the naturally brown colored egg and the white one.

There is most probably, however, an important dietetic difference between two eggs, the yolk of one of which is very pale yellow in color and that of the other a rich, almost reddish color. It is a notorious fact that the country-produced eggs may usually be placed under the latter description, while the egg produced by the hen who is under an unhealthy and limited environment shows an anaemic color, generally a very pale yellow. The eggs of wild birds, as, for example, the plover, show a yolk of rich reddish color.

The substance which contributes color to the yolk of the egg is iron, just as it is iron which gives color to the blood, and there seems to be little doubt that the iron compound in the yolk of the egg is of similar nature to that of the blood. It is easily assimilated, and eggs are regarded as a suitable food for the anaemic person, as they present a concentrated and generally easily digested form of nutriment rich in iron. The iron compound of the egg has, in fact, been termed a "hamatogen," because it is probable that from it the blood of the chick is derived. The amount of iron in the yolk of an egg would appear to increase with the intensity of the color, and there can be little doubt that the maximum is reached in the richly colored yolk of the egg produced by a fowl existing in healthy surroundings, for then its processes of nutriment would be working under favorable conditions. As an article of diet, therefore, the egg should be judged, not by the color of its shell, but of the yolk, which should be of rich reddish rather than of a pale yellow color.—The Industrial Hen.

COTTON SEED MEAL FOR POULTRY.

The superiority of cotton seed meal as a food for cattle, either as a fat and flesh producer or for milk and butter, has so long passed the experimental stage as to admit of no discussion. Its use as a most valuable hog feed giving growth, flesh, development and fecundity is also established beyond controversy. That it is equally as valuable as a supplemental grain ration for horses and mules under all sorts of conditions, and especially so for brood mares and young colts is also acknoledged by all who have given it fair trial.

So, too, its use as a most superior food for all kinds of fowls is being demonstrated in the yards of many poultrymen who have learned, by experience and test, to give it first place as an egg producer, and for fat, flesh and condition.

For, as will be at once seen, the same high albuminoid content which produces flesh and milk in cattle, development and fecundity in hogs, bone, muscle and endurance in horses, will give eggs, vigor and condition in fowls.

As in the other cases, it should always be fed to poultry as a supplemental ration only, and mixed always with some less highly concentrated food—corn chops, corn meal, wheat bran, shorts or small grain. Mixed in this way, about one-third to one-half cotton seed meal, it may be fed either dry or wet into a thin dough, and the result will be quickly shown in added vigor, rapid growth, glossier plumage and in increased egg production.

In fact, as with hogs, it seems to act almost entirely as a preventative of nearly all diseases, and instances are absolutely unknown where any epidemic prevailed in flocks having it as a habitual ration. On the contrary, numerous cases can be cited where they have remained entirely immune and healthy while neighboring flocks not having it have been destroyed by cholera and kindred diseases.

THE MUSLIN CURTAIN.

The muslin curtain as a substitute for glass windows began its career in the poultry house, gave so much satisfaction and received such indorsement that some of the dairy folk thought it might do the trick equally well for their dairy barns. And so it does, according to the enthusiasts. They say the temperature is not very much lower where muslin is used and the air is robbed of some moisture in passing through the muslin, so that there is less dampness than in a more tightly closed barn. Professor King, originator of a very popular system of barn ventilation, has criticized the so-called "muslin system" pretty severely. The farmer does not need to rely upon heresay or theory—"hot" air or "cold"—in this matter. He can soon settle the question for himself.

Water supplies at Yreka, Siskiyou county, are shorter than they have been before for years.

NORTH FAIR OAKS—ALTADENA CARS

Small Fruits and Vegetables

THIS MONTH.

August is the poorest month of the year for planting vegetables of any kind. It is too early for the winter varieties and getting late for summer kinds. Sweet corn can be planted in this month and come in the fall months as delicious as ever. The first sowing of tomatoes for winter crops is made. Second crop of potatoes is planted this month. Cabbage, cauliflower, celery and onions are sown for main crop. Yorkshire Hero green peas are sown by market gardeners this month.

RHUBARB COMPETITION.

WE NOTE on page 92 of the 1908 Premium List of the California State Fair that J. B. Wagner, of Pasadena, grower of the famous Winter Rhubarb, offers the following special prizes: Best exhibit winter rhubarb, $50 worth rhubarb plants; second best, $25 worth plants; third best, $10 worth plants.

To all who compete and do not win one of the above prizes, $2.50 worth of plants. Competition open to all.

It may be noted above that every man, whether a premium winner or not, who makes an exhibit of winter rhubarb will receive a special reward of at least $2.50 worth of plants of Mr. Wagner's growing. It is already somewhat late to give information concerning the growing of a premium winner rhubarb for the coming fair, but the following hints in a letter from Mr. Wagner may yet be of some value. Mr. Wagner says that if these directions are followed, very satisfactory and surprising results can be obtained. "Cut off carefully all buds except a couple of the strongest. Simply cut off close to the ground, thus forcing all growth to the two crowns or buds. To stimulate to its utmost get a large flower pot or old five-gallon oil can, perforated at the bottom and on the sides near bottom. Plunge in ground a foot and a half from plant and nearly to its full depth. Fill this can or pot often with liquid manure and water of which too much can hardly be used. A good substitute for liquid manure is nitrate of soda, dissolved in water, using about a teaspoonful to two or three quarts. Be sure and apply one of these stimulants every two or three days. Results of this work will, indeed, be most surprising and of itself pay any one for the effort."

Mr. Wagner adds that exhibitors need be at no expense in making these exhibits as they may be entered with the county exhibit. While no limit will be placed on the size of these exhibits, it is preferred that a small box of say 10 or 12 pounds be exhibited by many small growers rather than one exceedingly large exhibit. Principal factors will be quality, size and neatness and these will dominate in making the awards.

Mr. Wagner writes that he will make an exhibit at the fair but will not in any way compete for the awards. His exhibit will be principally of rhubarb which has not been forced and will consist of many varieties now being tested at his grounds in Pasadena, including some medicinal barbs, together with the new Giant variety he is now propagating.

Incidentally we learn that in connection with Mr. Loftus of Los Angeles, Mr. Wagner anticipates planting from one to two hundred acres of winter rhubarb next season.

FARMING BY THE SQUARE INCH.

This is the story of a remarkable solution of the secret of success in farming on a small scale, chiefly for the benefit of those who cannot afford to buy large tracts of land and would not be able to work them if they could. To pique the curiosity of the reader, let it be first explained, in all seriousness, that if a farm cultivated in this way is leased it should be understood that when the tenant moves he is at liberty to take the soil with him.

The soil used in this method of farming must be of unusual richness. The story begins with the efforts of two women to gain a livelihood from mother nature. They leased five acres of land in Berkshire, England. Later they found that five acres was too much land and that they could find full work for themselves and for students who flocked to them to learn how it was done, with profit to all, on a piece of ground less than half the size of that first taken.

The teachers of the women were a French gardener and his family, who, with an acre of land in France, sold $2500 worth of produce in a year. The scene at the farm is thus described by one who visited it:

In a bare plowed field stands a square palisade of zinc plates inclosing about three-quarters of an acre. Behind it the French gardener and the women who lease the land have wrought what looks like a sheer miracle to any one unacquainted with the system.

The ground is all covered with inverted bell glasses of the kind known in Europe as clochers. Under each bell at the time this writer visited the farm were five lettuces. Lettuces were growing around the bells and other vegetables sown broadcast were coming up everywhere. In each of a number of frames four feet square were thirty lettuces, a mass of carrots and cauliflower.

The entire secret of the growth of these products before the regular season is in the cropping and the soil. Every inch of the soil bears at least three crops a year, each of them anticipating the season and, therefore, producing fancy prices.

This remarkable method of making every inch of ground count is described in detail by the writer and the article is illustrated with very interesting photographs.—Exchange.

WEEDS.

You know some people say weeds are a blessing to mankind in that if it were not for weeds we would not stir the ground enough, and the plants would not get as much cultivation as they deserve. It may be so, but I hate weeds anyway. I hate them like the housekeeper hates dirt. You know some women say they have fought dirt all their lives and they will be buried in dirt when they die. It is the same with me, I have fought weeds all my life, but I sincerely hope I won't be buried in weeds.

To prevent maggots from attacking the cabbages, use wood ashes mixed with three times their volume of water poured about the roots of the plants when set out.

If bugs appear on the melons or squash, sprinkle tobacco dust about the plants.

Paid Semi-Annually

7%
Assured Profit

We offer you Cane Sugar Lands in Mexico. Perfect title. Give 50-year contract to cultivate for you, guaranteeing 7%, paid semi-annually, until crop profit exceeds this amount. Offer these lands for cash or on easy terms.

A Life Income from Land

Sugar Plantations produce the greatest continuous yield of any known crop. Tropical Mexico stands today unmatched in soil, climate, water. We own over 9000 acres in the heart of the best section—near Tampico. You become a land-owning profit-sharer in this project. We do all the work for you.

Sugar Plantations the Most Profitable Crop in All the World

One Acre Should Produce $203.52 Annually
Five Acres Should Produce $1017.60 Annually

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Diseased Peaches.

I send peach leaves from one-year-old grafted trees. They are apparently affected with some disease that kills the leaves and stunts the trees. What is cause and cure?—W. S., Burbank.

Prof. Smith says: In regard to samples of diseased peach leaves recently received, would say that these leaves show some indication of a shot hole fungus, but from the specimens submitted this seems scarcely enough to account for any very serious trouble. The leaves have much the appearance of having come from a tree which was in poor condition generally. This may result from some trouble with the root, such as root knot, or from some other weakness in the tree. I would advise your subscriber to dig up an affected tree and examine the roots carefully and see if there is not some indication of something wrong with them.

Watermelons Dying.

I have noticed for the last two weeks that some of my watermelons are dying without sign of insects or gophers. I think they are afflicted with some kind of disease. Enclosed find sample. Kindly answer as to disease and remedy.

Also how does dry rot enter into potatoes? I have about three acres with nearly every potato affected. The seed were perfectly healthy. Is the fault in the soil? Can these potatoes be used as stock food without injury?—Subscriber, Arroyo Grande.

Referred to Prof. Ralph E. Smith of Southern California Pathological Laboratory, who writes:

The specimen of watermelon vine is evidently affected with the disease called "wilt." This takes the form of a dry rot on the stem just under ground, which causes the top to wither and die. It is caused by a fungus which lives in the soil and cannot be eradicated by any known method. The only way to control the trouble is to plant watermelons on land which has never grown the crop before. The disease rapidly increases from year to year if watermelons are grown repeatedly on the same ground. Care must be taken not to put anything on the ground which has had any connection with previous crops of watermelons, such as manure containing the old vines. The disease is also sometimes spread by water running from affected ground on to the other land. The watermelon seems to be the only plant affected by this particular fungus, so that cantaloupes, cucumbers, squash, pumpkins and other crops can be grown on affected land.

As to the dry rot of potatoes, we would be pleased to receive specimens of this trouble. From the description given we are not able to tell just what it may be.

Cucumber Pickles.

Please give formula for cucumber pickles, both sweet and sour.—C. M., Oroville.

Here is a very simple recipe for the sour pickle. A much more complete and better one may be found on household page.

Make brine strong enough to bear up an egg and put in fresh cucumbers. When needed for use soak out and put in vinegar.

Tomato Catsup.

Please give recipe for good tomato catsup.—C. A., Napa.

See household page, this issue.

Possibly Aphis.

I have noticed that some leaves of my muskmelons are covered with spots which look white on the top and yellow on the other side. Other leaves are turning yellow along the vine. Is this a disease and what is remedy?—A Subscriber, Arroyo Grande.

It is impossible to give a definite answer to such a question. We have seen leaves covered with aphis which appeared much as you say these do. It is possible these insects are infesting your vines.

Gypsum.

Will you please inform me when to buy land plaster and the price per ton; also freight to S. F.—Subscriber, Arcata.

The Fire Pulp Plaster Co. of S. Alameda street, Los Angeles, say they will ship land plaster or gypsum f. o. b. San Francisco at $7.00 per ton, in car lots. Regarding smaller quantities, should you wish, write them.

Lawn Making.

Please give me best method of making lawn. What kind of fertilizer to use, soil being clayey. What preparation will the ground need, also what kind of seed to plant.—Mrs. E. C. G., Los Angeles.

A lawn may be planted almost any month of the year in California, but we believe now we would prefer to wait until October or November, and if the ground is sufficiently heavy clay to make it sticky, it would take that length of time or longer to get it in condition. We would cover with stable manure which should be deeply spaded in. Then keep thoroughly wet for some weeks to start all the weeds possible, which should be kept hoed down. The writer of this at one time made a lawn on heavy clay soil which cracked so badly it was necessary to haul in a loam to give a surface better fitted to receive the seed. In that case nearly six inches of sandy loam was covered over the clay, although two or three would have answered. The manure, if it be well rotted, should have but few seeds and earlier planting could be given; but in any case a few months wetting and hoeing will put the soil in better condition. Soil can hardly be made too rich for a fine lawn. Finely ground bone meal is one of the best commercial fertilizers to use, either on the lawn or on ground being prepared for seed. Getting the ground ready is one of the most important factors in making the lawn. The kind of seed to plant is a matter of taste largely, although the blue grass is preferred by most people. The writer prefers a mixture of blue grass and white clover, which makes a beautiful lawn and is easier to keep in good condition than one of blue grass only. If the lawn is under trees or where heavily shaded then blue grass has the preference, for it will stand shading best of any grass. Make the surface even, and while it should be well rolled or tramped to firm the subsoil, the surface should be fine and mellow with repeated rakings. Sow seed thickly, on still morning before breeze starts to blow and cover with rakings from cow corral which should be screened to a fine dust. This may be put on to depth of ¼ or ½ inch. Wet two or three times daily till established.

Oranges as Fertilizer.

Would you please tell me through the query column of the value of oranges as fertilizers for orange trees? What value have lemons as fertilizer for lemon trees? If lemons are used as fertilizer on orange trees will they cause oranges to be sour? Amateur, Lakeside.

At one time orchardists feared to put oranges and lemons on the ground for fear of the effect of the acid on the soil, but we believe this fear has entirely passed and now culls from packing-houses are hauled to the orchards and plowed under. The only objection to this is in the carrying to the orchard a vast number of the spores of blue mold or the mold which causes the rot of oranges. This now causes more orchardists to refuse to have them in the orchard than fear of any effect upon the soil. If put in the compost heap and thoroughly rotted down before applying to the orchard, we presume they would make good fertilizer. Lemons applied to orange orchards would have no effect upon the flavor or sweetness of the fruit.

Almond Hulls.

Are almond hulls good for sheep?—B.

This was referred to Dr. Twombly, and while he has had no experience, his opinion is that they would be of little nutritive value.

Runners on Strawberries.

I am a beginner in growing strawberries for market. I would like to know whether to keep runners off strawberry vines or allow them to grow and root. Some tell me the latter is the best. My idea is to keep off all runners. Kindly advise.—A Subscriber, Carpenteria.

By all means keep off the runners if you want abundance and good quality of fruit. When it is desired to grow the vines for resetting, then get the thriftiest and best young plants possible, and grow the young vines from runners before the parent plants have ever fruited. This will give vigorous plants and the older vines will soon give good crops. When bearing begins, however, keep down all runners.

Drying Figs.

Kindly advise as to drying figs in a small way, not for market, but simply home use.—S. B. L., Gardena.

Allow fruit to become fully ripe on trees; some even allow it to drop and pick up from the ground. If picked green the skin is tough and leathery. Dry on trays but do not let it get too dry and hard. After drying some place in box and sulphur,

DON'T BUY GASOLINE ENGINES UNTIL YOU INVESTIGATE "THE MASTER WORKMAN," a two-cylinder gasoline, kerosene or alcohol engine, superior to any one-cylinder engine; revolutionizing power. Its weight and bulk are half that of single cylinder engines, with greater durability. Costs Less to Buy—Less to Run. Quickly, easily started. Vibration practically overcome. Cheaply mounted on any wagon. It is a combination portable, stationary or traction engine. SEND FOR CATALOGUE. THE TEMPLE PUMP CO., Mfrs., Meagher and 15th Sts., Chicago. THIS IS OUR FIFTY-FIFTH YEAR.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

same as ordinary dried fruit, in order to kill all insect eggs which may infest the fruit. Lately, however, most have preferred dipping in a boiling salt solution. This has been found equally good and the short drying of the surplus moisture in midday sunshine fits the figs so they may be packed away and they will keep.

Thrips.

Please give me the name of insect infesting bean leaf which I mail you. —Mrs. J. F. A., Sunset City, Sutter Co.

This leaf was submitted to Prof. Quayle of Whittier and he reported that it had every appearance of having been infested with the thrips. This insect is very susceptible to kerosene emulsion spray, which should be applied very weak to bean vines as the bean will not stand a strong spray. The ordinary method of making the kerosene emulsion is one gallon kerosene, one gallon water, one-fourth pound laundry soap. This, thoroughly churned and mixed together for fifteen or twenty minutes, is the stock solution, one gallon of which should be added to twenty-five gallons of water. But in the case of beans, instead of twenty-five use thirty-five gallons of water, which will be abundantly strong to destroy the pests. It is probable, however, before this is read, that the pest will have disappeared; but the effect upon the vines will not disappear so quickly.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Kidney Worm.

I have a valuable hog which seems to be seriously affected in her hind parts, which she drags after her, having no use of them. Seems to eat well. What is trouble and remedy?

These symptoms would seem to point to what is called the kidney worm. If this is it, there is no cure. Would advise examination when she is killed.

Cribbing.

I have a four-year-old colt which I regret to say is a "cribber," or as some call it, a "wind sucker." Is there a remedy?—L., Pomona.

This is a habit which it is is almost impossible to cure. A strap buckled tightly around the throat will prevent them from sucking down any air. If kept in a box stall where there is no place for them to catch their upper teeth, they may sometimes forget the habit. Where this is done, hay may be fed from a rack instead of a manger.

Sunstroke.

I have a valuable mare which seems well and hearty, but as soon as the sun rises she begins to pant and seems badly affected with the heat, but it is impossible to start a sweat on her. A year ago she would pant when I worked her, but now she does it all the time. And she is losing her appetite.—H. B., Coachella.

I think your animal has been overheated, which has resulted in a partial sunstroke. At least that is the way they act after sunstroke, and they seldom entirely recover.

California Farm Names

ONLY a few farm names have been reported this week, but sufficient to show there is much interest in this feature of the Cultivator. We believe this campaign will continue for some time as people more and more become aware of the real advantage to a place in having a name of its own. A northern exchange, in speaking of the benefit of naming the home, says:

When your children and grandchildren return from their new homes twenty-five or fifty years from now, no matter who the owner may be, the old farm will go by the old name, associated with many of the most pleasant recollections of life.

As a matter of fact, you will think more of the old farm because it has a name of your own choosing; a permanent, fixed, well recognized name, like the name of the nearest town or station. You will take better care of it; take better care of the improved live stock which carries the name of the farm.

Having selected a suitable name, let that name be inscribed at the entrance, or put it in some other way about the buildings or at the nearest cross-roads, so that the public will become familiar with it. Then have it printed on the stationery that you use in your correspondence.

Names Sent in This Week.

"Minnewawa Vineyard," owners, Dr. and Mrs. W. N. Sherman, Fresno. This is the home place of Mr. and Mrs. Sherman, on which the delightful homestead is. There are 640 acres given over to the growing of olives, raisins, peaches, table grapes, oranges, plums, alfalfa and live stock. It is five miles east of Fresno and near an electric car line into the city.

"Palomitos Vineyard," owners, Dr. and Mrs. W. N. Sherman, Fresno. Palomitos is Spanish for "little doves." This vineyard is planted largely to Malaga and Emperor table grapes, also to raisins and alfalfa. It is six miles northeast of Sanger and twelve miles east of Fresno.

"Keystone Ranch," owners, Dr. and Mrs. W. N. Sherman, Fresno. In this ranch are forty acres devoted to alfalfa and live stock. It is ten miles south of Fresno.

"Glendell Grove," owner, Monroe Miller, Lakeside, San Diego county. Mr. Miller writes: "We are in a nice glen or dell and have combined these two words to make the name of our place. We are twenty miles northeast of San Diego. We have twenty acres in lemons, ten in oranges, also deciduous fruits and alfalfa. A fine live oak in the back yard shades a circle 150 feet in diameter. Near it is a big rock forty feet square."

"Highland Farm," owner, H. R. Ives, El Cajon Valley, San Diego county. Mr. Ives writes that he has taken this name because of the fact that the ranch is located on the higher lands of the foothills, at the base of towering hills or mountains. "I have fifteen acres, about six of which are in an orchard of oranges, lemons, plums and peaches. Expect to plant more of both citrus and deciduous fruits. Soil is excellent, of decomposed granite. Place situated at southeast corner of valley, with flume as upper boundary. This having water circling about the place makes it most attractive and inviting."

"Paradise Ranch," owner, C. H. Carlson, Hughson, Stanislaus county. "This ranch is located within the limits of the little city of Hughson and we intend to make it like a perfect paradise, hence the name. I intend to make a concrete arch at the entrance, in which will be the name of the ranch and the proprietor. I do not see how any one can get along on a farm in California without the Cultivator. I would surely have it if it cost $5.00 a year."

"Anchorage," owners, Capt. and Mrs. Oscar Kustel, Ontario, San Bernardino county. The Anchorage is given up to the growth of Washington navel oranges.

SOUTHERN PACIFIC INSTRUCTION CAR.

The Southern Pacific is operating an instruction car over the entire route of its Pacific system, being in charge of a corps of expert lecturers, for the purpose of explaining to employees more thoroughly the theory and practice of railroading, particularly in its relation to accidents.

The Harriman lines have spent several million dollars for improved block signal safety system in the last few years, and indeed the Union Pacific and Southern Pacific have more mileage protected by the latest improved block system than any other three large railway systems of the country combined. With these devices comes the necessity for increased education of the man, and the company, through a traveling school, is endeavoring to help them gain the necessary instruction.

The instruction is organized as carefully as a college course. The car has a completely equipped school room, in which the lecturers hold forth to yardmen and all employees who come in contact with the operation of trains. At the lecturer's desk is a miniature block system, by means of which the "pupils" can be graphically shown the operation of the wonderful system in minutest detail. Behind are charts illustrating change of time table, and blackboards showing tabulated systems with rules governing change in all kinds of trains, and orders for trains by telegraph.

The car is now on the Coast Division and has since last October covered the entire system. It will be five more weeks on the trip completing it about August 31st, the last three weeks being spent in San Francisco. The car is run as an extra, stopping at each station to examine and instruct railroad telegraph operators and at yard terminals the school sessions are held in the forenoon and afternoon.

This work is entirely in addition to the ordinary examinations given employees before they enter the service, while the public's chief interest is in the fact that it makes the men more competent through advanced knowledge. Yet it has a great interest for the men also in that it enables those desirous of increasing their knowledge and bettering themselves to gain capacity and, therefore, stand better chance to gain in position.

Southern California walnut growers are anticipating good results from the new method of bleaching walnuts, which consists in treating a solution of salt with a current of electricity. It is said to be even superior to the old method, which is the cause of a great many suits which were entered by Anderson, Barngrover & Company, owners of a patent.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Several hundred iron fence posts. R. KELLY MACHINERY CO., corner of Mission road and Macy street, Los Angeles, Cal.

FOR SALE—SECONDHAND PIPE AND oil well casing, all sizes, any amount; boilers and engines; gas and distillate engines; pumps, etc. Get our prices before you buy. A. CANNADY & CO., 1029 N. Alameda St., Los Angeles, Cal.

CLOSING OUT GASOLINE ENGINES NEW and secondhand from 5 to 60-H. P. and other machinery. See us before buying. Can save you money. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles.

FOR SALE—AT HALF ACTUAL VALUE No. 7 U. S. Cream Separator, good as new. One No. 9 machine new, to close out. K. B. Norswing, 5833 S. Main St., Los Angeles.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FOR SALE—21-H. P. OTTO DISTILLATE engine in fine running order at an exceptionally low price. 117 BRUNO ST., LOS Angeles.

FOR SALE—6-H. P. INTERNATIONAL also Peerless engine; never been used; at a snap. N. W. cor MAIN and BRUNO STS., Los Angeles.

FOR SALE—5-H. P. ALTERNATING CURrent motor in good running order. Cheap. BAILIE & BRANDT CO., 943 Main St., Los Angeles.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

FOR SALE—A BARGAIN—20 ACRES ALfalfa; 2 wells; 12-H. P. pumping plant; 9-roomed house, barn, furnished complete, with cows, pigs and farming tools; family orchard; ¾ mile from town of San Jacinto. Address L, BOX 37 or 'phone 676 Home.

EGGS FOR HATCHING.

EGGS FROM MY PRIZE WINNING BARred Rocks; won all firsts, all seconds but one, and all specials on Barred Rocks at L. A. C. P. A. Show, 1907. Eggs from best pens, $3 per 15; $12.50 per 100. Stock for sale. CHAS. E. SMITH, Gardena, Cal. San Pedro Interurban car to Smith's Crossing.

POULTRY

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. Regular 10c can free, postage paid, for 10 addresses of poultry keepers. WEST COAST MILL, 705 Griffin Ave., Los Angeles, Cal.

FOR SALE—STOCK AND EGGS OF THE following standard bred poultry: Black and White Orpingtons, Brown and White Leghorns. J. J. Verkouteren, Route 3, Hanford, California.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

CATTLE.

FOR SALE—TWO YOUNG JERSEY BULLS—For particulars address DR. C. S. LANE, Santa Barbara, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Anfield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

FOR SALE—COCKER SPANIEL PUPS, 8 weeks old; blacks, $10 each. MINNEWAWA VINEYARD, Fresno, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

SEED.

FOR SALE—EUCALYPTUS RUDIS SEED, fresh, by pound or ounce. MINNEWAWA VINEYARD, Fresno, Cal.

PARTNER WANTED.

WANTED—A PARTY TO TAKE AN INterest in my seed and poultry supply business, who has a good nursery and can furnish plenty of nursery stock. Have a fine store; grand location and splendid opportunity. Address or call, S. H. CHURCH, 636 S. Main St., Los Angeles.

NURSERY FOR SALE.

OLD ESTABLISHED NURSERY BUSINESS for sale. Good stock. Good location. Good reasons for selling. Address THE AUBURN NURSERIES, East Auburn, Cal.

THE MAN BEHIND THE PLOW.

There's been a lot to say about the man behind the gun,
And folks have praised him highly for the noble work he done;
He won a lot of honor for the land where men are free—
It was him that sent the Spaniards kitin' back across the sea.
But he's had his day of glory, had his little spree, and now
There's another to be mentioned—he's the man behind the plow.

A battleship's a wonder and an army's mighty grand,
And warrin' a profession only heroes understand;
There's something sort o' thrillin' in a flag that's wavin' high,
And it makes you want to holler when the boys go marchin' by;
But when the shoutin's over and the fightin's done, somehow
We find we're still dependin' on the man behind the plow.

They sing about the glories of the man behind the gun,
And the books are full of stories of the wonders he has done;
The world has been made over by the fearless ones who fight;
Lands that used to be in darkness they have opened to the light;
When God's children snarl the soldier has to settle up the row,
And folks haven't time for thinkin' of the man behind the plow.

In all the pomp and splendor of an army on parade,
And through all the awful darkness that the smoke of battles made;
In the halls where jewels glitter and Where shoutin' men debate;
In the palaces where rulers deal out honors to the great,
There is not a single person who'd be doin' bizness now
Or have medals if it wasn't for the man behind the plow.

We're a-buildin' mighty cities and we're gainin' lofty heights;
We're a-winnin' lots of glory and we're setin' things to rights;
We're a-showin' all creation how the world's affairs should run;
Future men'll gaze in wonder at the things that we have done,
And they'll overlook the feller, just the same as we do now,
Who's the whole concern's foundation —that's the man behind the plow.

—S. E. Kiser.

HOW PERRY BECAME A HERO.

PERRY ADAMS sat in his room poring over a big book. Every little while he would jot down some passages from the book on a bit of old wrapping paper with a stub of lead pencil. And as he worked he shivered, for it was zero weather without and extremely cold within. There was no artificial heat of any kind in the room, which was almost bare of furniture, and showed that the occupants of the house, of which this room was a part, were very poor.

Occasionally Perry would warm his benumbed fingers over the little coal oil lamp which spluttered and smoked on the table in front of him. He was wrapped in a bedquilt against the drafts that came in round the rattling window and beneath the ill-fitting floor which led out of doors.

Just as the clock was on the point of striking 8 a door which communicated with another room was opened and a pale, sad faced woman came in, speaking gently to Perry.

"Son, here's a cup of hot tea. It will warm you up a bit as you work. I wish we could afford to keep a fire in the kitchen, for then you could go in there and study of nights. But coal is so dear that we can scarcely afford to have enough to keep the stove warm during the day."

"How did you make the tea, mother, dear?" Perry asked, taking the cup of steaming beverage and drinking it off.

"Over my lamp, dear," replied the mother. "I held a tin cup of water over the lamp flame till it boiled. Then I dropped in a pinch of tea. Is it nice and hot, dear?"

Perry rose from his chair, though it was somewhat of an effort to do so, wrapped as he was from neck to toe, and put his arms about the pale little mother. "Yes, mother mine, the tea is excellent," he said, in a loving voice. "And you're the best mother in the world. Now you'll catch cold if you remain up without fire, so go to bed and keep warm. The fire is all out in the kitchen, isn't it?"

"Yes, an hour ago, and you could put your hand on the stove. But I've been sitting beside it doing some mending. I have fixed up your coat—darned the broken places and cleaned the collar."

"Ah, little mother," said Perry, tenderly, "you are always doing something for me. When shall I ever be able to do half as much for you?"

"All I ask is that we may some day be able for you to go to college, where you may be able to pursue your favorite study of electricity. I ask for nothing for myself—only for health to watch over my boy and to minister to his wants. It is very hard for me to see you working day after day, month after month, and year after year for our support, when you should be in school fitting yourself for the real work of life. And I feel that I am so helpless in the matter." The loving mother's eyes were a bit misty as she said this to her boy and Perry, kissing her, assured her that she was first in his mind and heart and the study of electricity only secondary. "Of course, mother mine," he went on to say, "I'd love to make a thorough study of electricity, for I really believe that I might make some wonderful discoveries some day. But—there's an ocean of time. I'm but 16 years old. If I manage to keep the position I now have in Mr. Green's store, we will be able to lay away a few dollars each month. After we've played the miser for a few years we'll have enough to enable me to go to college. And you shall go with me. We'll take a little cottage—maybe one with a few spare rooms to let out to other students and thereby help out with the rent. Oh, I've thought it all out, mother dear, and all we must do is to be patient and wait—wait—"

"Oh, you dear, courageous boy," said Perry's mother, kissing him and compelling him to be seated at his desk again. "And now I shall go to bed, for you have only an hour to study. I must not keep you talking when you should be alone with your books."

But just as Mrs. Adams was about to retire to her bedroom a quick knock was heard on the door, and she hurried to see who was demanding admittance at so late an hour. A neighbor's child stood there stifling frightened sobs. "Oh, Mrs. Adams, please may Perry go for the doctor? Ma says brother has the croup an' may die. She says to hurry, please."

Perry was out of his quilt and into his hat and overcoat like a flash. As his home was almost a mile from the town where he must go for the doctor, he decided to run with all possible speed and borrow a neighbor's horse to ride on the errand. This he did, and was soon going at a brisk trot toward the town. A railroad cut, some 60 feet deep, lay between him and town, and was crossed by means of a bridge. Perry was nearing the cut when the sound of a horse's hoofs sounded close behind him. From the sound Perry judged the traveler to be coming at a good pace and drew his horse's rein, guiding him outside the road to let the coming vehicle pass.

A great black horse, head thrust out, nostrils dilated, neck strained to the utmost tension, dashed past him, dragging a buggy which held only one occupant. In an instant Perry saw that the horse was running away and that the driver had lost one of the lines, which was loosely whipping the ground beside the running animal. About an eighth of a mile further on the road turned abruptly to the right, following the line of the railroad cut for a quarter of a mile before reaching the bridge. Perry's heart stopped as he thought of the danger of the rider in that buggy. Suppose the horse should go straight ahead instead of taking the turn to the right. Within 200 feet horse and man would go over the level edge of the cut, landing on the tracks sixty feet below.

Perry's horse had been left behind by the running animal, but now his rider laid whip and hard strong heel to him, urging him to run. On and on, faster and yet faster, ran Perry's horse, a big, strong, well-fed animal that seemed to enjoy trying his speed against that of the runaway.

"As I feared. He didn't take the turn." Perry gasped the words. But he was now beside the running horse. The occupant of the buggy was helpless and could only hold on and await the inevitable.

Perry strained every nerve. His horse was now neck and neck with the runaway. Only about 100 feet lay between the racers and the edge of the ditch. Perry knew that his own life was in danger, but he would not shirk the work before him. Reaching out he grasped the bridle of the running horse, jerked upon it with all his excited strength, holding to the horn of his saddle with his other arm and crying "Whoa! Whoa!" to his obedient horse. His own horse stopped suddenly, as if he realized the danger that was just in front of him. And in doing so he caused the other horse to plunge, rear and drop to his haunches.

And then it was that Perry and the man in the buggy had the opportunity to look at each other. The man had quickly jumped from the buggy and was holding his horse's bit. "Why, upon my soul, my rescuer is none other than Perry Adams! Wait a bit, my boy, till this animal quiets down, and then I'll get hold of that right hand of yours and tell you what I think of a boy who would risk his life as you have risked yours to save that of a fellow creature."

"Why, Doctor Downs!" cried Perry, himself a bit out of breath and glad of a chance to drop off his horse for a minute. "Well, since I've found you here, I'll not have to go into town. The Browns' baby has the croup and I was coming to fetch you to do what you can for it."

"We'll fix these lines, Perry, and together we'll return to the Browns. I have a lot to say to you, boy, and I'm blamed if I can find words fine enough to express my gratitude."

"That't all right, Doctor," said Perry. "I understand how you feel, so we'll let the matter pass. I only did

"God give us men! A time like this demands
Strong minds, great hearts, true faith and ready hands;
Men whom the lust of office does not kill;
Men whom the spoils of office cannot buy;
Men who possess opinions and a will;
Men who have honor—men who will not lie."
—Holland.

what any one with a heart in his breast would have done. You owe me nothing, Doctor."

But Dr. Downs felt differently about the matter, and one day a few weeks later he walked into Perry's home with some very startling and splendid news. After he had talked to Perry for a little while he took his leave, grasping the boy's hands and saying earnestly: "And may the best luck in the world be yours, my boy. You are not only a hero but as fine a specimen of young manhood, of honor and industry as I ever saw in all my life. Good-by and good luck."

Perry ran into the kitchen, where his mother was preparing supper "Mother mine, we are to pack and go to D——, wnere we'll take the little cottage near to the college, for I've been declared one of those Carnegie heroes and Dr. Downs has just told me that I am to have $2000 to spend on my education! The money comes from the Carnegie Hero fund. And, what's more, Dr. Downs insists on putting another $500 to the fund. He declares that I saved his life at the risk of my own. He says there was no possible chance of his escaping death had I not come to his assistance. You see, the railroad fence along that part of the cut had been blown down by the blizzard, and there was nothing between the doctor and the ditch. But, mother dear, what are you crying for? I feel like laughing and laughing, and then falling on my knees and thanking God for the good fortune that has befallen me."

"I'm crying for joy, my dear, heroic son." said Mrs. Adams. "But like you, I feel like falling on my knees. Come, let's give thanks to our Creator together, son."—Florida Agriculturist.

RECIPES.

Cucumber Pickles.

Cover the bottom of cask with common salt; gather the cucumbers every other day, early in the morning or late in the evening, as it does not injure the vines so much then as in the heat of the day; cut the cucumbers with short pieces of the stem on, carefully laying them in a basket or pail so as not to bruise; pour cold water over and rinse, being careful not to rub off the little black briers, or in any way to bruise them, as that is the secret of keeping them perfectly sound and good for any length of time. Lay them in a cask three or four inches deep, cover with salt, and repeat the operation until all are in; pour in some water with the first layer—after this the salt will make sufficient brine, Now spread a cloth over them, then a board with a stone on it. When a new supply of cucumbers is to be added, remove stone, board and cloth, wash them very clean, and wipe every particle of scum from the top of the pickles and sides of the cask; throw away any soft ones, as they will spoil the rest; now put in the fresh cucumbers, layer by layer, with salt to cover each layer. When cask is nearly full, cover with salt, tuck cloth closely around the edges, placing the board and weight on top; cover the cask closely, and the pickles will be perfect for two or three years. Cucumbers must always be put in the salt as soon as picked from the vines for if they lie a day or two they will not keep. Do not be alarmed at the heavy scum that rises on them, but be careful to wash off all the board and cloth. When wanted for pickling, take off weight and board, carefully lift cloth with scum on it, wash stone, board and cloth clean, and wipe all scum off the cucumbers and sides of cask, take out as many as are wanted, return the cloth, board and weight, and cover closely. Place the cucumbers in a vessel large enough to hold two or three times as much water as there are pickles, cover with cold water (some use hot,) change the water each day for three days, place the porcelain kettle on the fire, fill half full of vinegar (if vinegar is very strong add half water,) fill nearly full of cucumbers, the largest first and then the smaller ones, put in a lump of alum the size of a nutmeg, let come to a boil, stirring with wire or wooden spoon so as not to cut the cucumbers; after boiling one minute, take out, place in a stone jar, and continue until all are scalded, then pour over them cold vinegar. In two or three days, if the pickes are too salt, turn off the vinegar and put on fresh, add a pint of brown sugar to each two gallons pickles, a pod or two of red pepper, a very few cloves, and some pieces of horseradish. The horseradish prevents a white scum from rising.

Green Tomato Soy.

Two gallons tomatoes green and sliced without peeling, twelve good-sized onions sliced, two quarts vinegar, one quart sugar, two tablespoons salt, two tablespoons ground mustard, two tablespoons black pepper ground, one-tablespoon allspice, one tablespoon cloves. Mix all together and cook on top the stove until tender; stir frequently to avoid scorching. Seal in glass jars. This is a pleasant sauce for almost every kind of meat and fish.

Tomato Catsup.

Scald, peel and core a peck of sound, ripe tomatoes. Mash as if for stewing. Season with a teaspoon of ground black pepper, half a teaspoon of red pepper, one teaspooon each of cloves, allspice and mace, and three large onions cut very fine, with salt to taste. Put all in a porcelain lined kettle to boil, and when the tomatoes are thoroughly cooked rub the catsup through a sieve to get out the seeds and pieces of spice. After straining return to the kettle and let it boil until thick as cream. Set aside and when cold put into pint bottles, filling each to within half an inch of the cork, and pouring in on top of each a teaspoonful of salad oil. The bottles should be kept in a cool, dry place, resting on their sides.

Sweet Ripe Cucumber Pickles.

Take ripe cucumbers, cut in two, scrape out the seeds, cut into strips and soak over night in salt water. To every quart of vinegar add one pound of sugar; boil and skim. Boil the strips in the vinegar until tender and quite transparent. Take out the pickles, strain the vinegar, put it over the fire with a small muslin bag of mixed spices, boil two hours, pour over the pickles, cover and put away.

Will any subscriber who has a favorite recipe for making small sweet cucumber pickles favor other subscribers by sending it in?

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

The Produce Markets

Los Angeles Markets

LOS ANGELES, Aug. 5, 1908.

Butter.

Butter has advanced 5 cents for extras during the week, but owing to heavy recipts and decline in Eastern butter the tone of the market is very weak at this time though actual selling price to trade is 2½c advance on quotations.

Wholesale quotations now are:

Creamery ex per roll..........55
Firsts..........52½
Dairy..........25
Cooking..........22
"Butterine"..........15@20

Cheese.

Cheese is still weak though an effort is made to strengthen it by holders of large stock.

Southern California..........14½@17
Northern fresh..........13½@14
Longhorn..........17@17¾
Eastern singles..........16@16½
Cheddars..........17
Imported Swiss..........27@27½
Swiss..........17@17½
Oregon..........15
Limburger..........17½

Eggs and Poultry.

Eggs have advanced 1c during the week though a slight weakness prevails at the advance. It is predicted, however, that there will be no decline.

Eggs local candled..........30
Eggs case count..........26½@27
Firsts fresh..........29
Eastern fresh..........25@26
Eastern fresh jobbing price....21½@22
Storage..........23@23½

Wholesale prices..

Hay.

Somers & Co. say:

Shipments of hay to the San Francisco market are steadily on the increase, the total for the week ending today amounting to 4510 tons in comparison with 3770 for last week and 2910 for the week preceding that. Because of this increase, there has been a decided weakening in values here and receivers of hay have had the greatest of difficulty in handling arrivals without occasioning too bad a break. On standard grades of hay prices are off from 50c to $1.00 per ton and if present shipments are not curtailed there will be a still further decline. Considerable quantities of hay have been contracted for shipment to this market and if cars are furnished freely, we may expect a rather disappointing market for several weeks to come.

It is undeniably true that the hay crop is short throughout the State this year, but with the exception of the Livermore district all principal hay centers seem to have sufficient quantities to fill all available warehouse space.

Citrus Market

LOS ANGELES, Aug. 5, 1908.

The few oranges going forward now are being received well and commanding firm prices. The auctions are absorbing all the surplus and it appears as if the remainder yet to market will be cleaned up at satisfactory prices.

Shipments.

Shipments of citrus fruits to date aggregate 27,317, of which 4049 were lemons. To same date last season, 26,279, of which 3043 were lemons.

NEW YORK, Aug. 3.—Eight cars Valencias, one car grapefruit and one mixed car sold. The market is very steady on good quality stock, but lower on ordinary grades sizes 80s to 150s. There is a good demand for good quality grapefruit, but today's offering consisted of old stock that was unattractive. Weather clear and favorable.

A FACTORY TOWN IN THE CORNFIELDS.

From cornfield to manufacturing town and site of one of the largest industrial plants of the country is the transformation which a year has brought to a section of Illinois prairie about twenty miles from Chicago. The change has followed upon the organization of the eighty million-dollar Corn Products Refining Company to control the glucose industry of the United States. The new town, as yet unnamed, is growing up around the site selected for the company's five-million-dollar plant. The Standard Oil interests, which dominate the new corporation, are said to be responsible for the decision to build the plant in the center of the corn belt, and for the choice of the present location on a section of farm land about twenty miles from Chicago along the drainage canal. It is near the lines of several of the corn-carrying roads and a mile from the small town of Summit, Ill.

The Corn Products Company has no intention of emulating the policy of the Steel Corporation, which has built up a city around their new steel plants at Gary, Ind., and has concerned itself only with the glucose plant itself, but as soon as it became known in Chicago that the biggest plant of the Corn Products Refining Company was to be erected in the open country, real estate promoters flocked to the ground and started the development of the adjacent territory.

Work was begun on the new Corn Products plant last year, but it was decided for the present to build only one of the three units which are to make up the maximum capacity of 60,000 bushels a day. At the present there are about 800 workmen on the ground, whom the Corn Products Company are housing in temporary quarters, but the Chicago speculators have laid out and graded streets for a small manufacturing center and are in the midst of a campaign to bring new industries to the ground selected by the Standard Oil interests.

The Corn Products plant will not be ready for operation till next year.—American Industries.

THE NEW AGRICULTURE.

The Cultivator is in receipt of the 375-page book entitled: "The New Agriculture," published by Munn & Co., New York, at $2.00. The book is written by P. Byard Collins. It consists of ten chapters ranging from "The New Call to the Farm;" "The New Soil;" "New Fertilization;" "New Creations;" "New Machinery" to "New Inspirations." The book opens with a statement that "Back to the Soil" was never more attractive and never so heeded as during the opening years of the twentieth century. It appeals to us as being written more in the effort to show attractiveness of farm life to the city man and to get him to return to the farming industry. We hardly think it is written from a practical, hard earned knowledge of agricultural practices. We note in it some things like its commendation of the Spencer Seedless apple, which farmers have generally believed to be a fake of the first water, and which is here spoken of highly and compared with the navel orange. However, on the whole the book tends to dignify farm life and show its rightful position as compared to other callings. Along this line it says in the foreword:

"Farm life was never so attractive as it is today, and this, notwithstanding the fact that the present methods of production and distribution outside the farm leaves much to be desired. Almost unthinkable sums of wealth which the farmer annually creates is annually appropriated by a few powerful corporations, but this is not more true than that all other classes of workers are equally and even more terribly exploited. But an evolution so active that it approaches the phenomena of a peaceful revolution is going on in society, long standing abuses are being curtailed or abolished, and the present social system is destined in the near future to undergo profound modification before it is finally displaced by something better or transmuted into another form. While, therefore, farm life offers more inducements than at any previous period of the world's history, and vastly more in America than in any other country of the globe, from the present moment of reform to the final fruition of the social growth of which the reform is an indication, is the farmer to reap more and more nearly the full reward of his toil."

Pomona Pressure Gates

A Great Aid in Irrigation

These gates are made similar to the ordinary slide gates except that there is a locking device interposed to lock the cover in any desired position or to press the two faces together to make a WATER TIGHT joint, from either direction when closed. The parts are very simple, only a tapering screw with a split tapering nut socket. By turning the handle to the right tightens, and to the left loosens the cover or it may be removed entirely.

Preparing Cattle for Exhibition Purposes

An Address by H. G. Van Pelt at the Chicago National Dairy Show

FOR obvious reasons, the breeder of pure bred cattle realizes the importance of fitting and showing representatives of his herd at the County, State and International shows and fairs. Through these mediums, he and his cattle are brought in touch with a multitude of men and breeders who go to make up the great cattle industry of the world.

If success in the show-ring is attained, extensive advertising is gained and makes both breeder and herd popular, and the result is a ready demand for all surplus stock that can be thereafter produced. All exhibitors, however, cannot be winners. Nevertheless, if the cattle have been so prepared that they present an appearance that is a credit to the breed, the advertisement is of extensive value; but of greater value yet is the knowledge gained by the breeder in having impressed upon his mind the deficiencies of his cattle, and he goes home resolved to come back another year more strongly prepared to enter into the friendly strife of the show ring. Thus, the breeder who loses is prompted to improve on his old methods of breeding and feeding, and the one who wins knows well he must put forth every effort to remain in the front ranks another year, and in this manner it is plainly seen that to the show ring is due a large share of the credit of bringing our various breeds of cattle to their present high rate of perfection.

Many factors enter in to determine whether or not results gained from exhibiting justify the labor and cost involved in the operation. One time there is when it is certain that keeping the cattle at home is the advisable thing to do; that is when the breeder has not thought of showing until a few weeks before the time for the shows to begin. Thorough preparation of extended duration is an absolute necessity and great, indeed, is the time, labor and expense necessary to bring even the best of animals out in a winning condition; but he who considers the trouble and cost of preparation rather than the advantages to be gained by good fitting will never be a successful exhibitor, and his cattle will always be found in the lower ranks where they can add nothing to the fame of their breed or breeder. On the other hand, time and money judiciously spent in preparation will return large rewards in the form of prizes, advertisement and honor.

Sometimes it is advisable for the young breeder to exhibit cattle of other men's breeding, to let it be known the superior quality of his foundation stock; but the older breeder should always follow the plan of breeding his own show stock and showing his own breeding stock, then the ribbons won will bring home honors that are all his own.

To recapitulate then: The man who has surplus stock to place upon the market and has animals of superior show-yard merit, on which he is willing to devote his time and money to bring them out in the best possible condition, can do nothing better than to go ahead with the intention of supplying winners to the shows, always remembering the true English saying that "Anyone can show any kind of cattle and lose, but it takes a good man with good cattle to win."

Probably no mistake is made more often than the one of simply not beginning preparation early enough. Often we hear criticisms to showing, based on the fact that so many animals are ruined through fitting. I am thoroughly convinced that more cattle are ruined by a lack of real fitting than through good, careful preparation. The animals thus ruined are often caught up out of pasture three or four weeks prior to the show and crowded to their utmost capacity with corn and anything else that will suffice to lay on fat. This haste in getting ready, and hard grain, always leads to disaster. Fat is laid on the body, in the body and around the genital organs in large patches, resulting in a ruination of the beast for breeding purposes, and seldom makes a winner of it. If this may be called fitting, then fitting ruins cattle and should be done away with. True it is, and must be admitted, that the most careful fitting often injures more or less the breeding qualities of some of our best show animals; but the better herdsmen, and those who win the most ribbons, seem to have the least trouble from this source. The main reason for this is that they extend their feeding over a longer period and are not compelled to crowd their animals so rapidly.

The older members of the herd should be selected at least ten months prior to the show, and the calves a year before this. In fact, the breeder should take great pains in breeding for his show calves. The careful breeder knows the cows that produce his best calves; it is not always the cow possessing the best show-yard form either, but through some peculiarity she nicks just right with the sire and produces a calf of outstanding merit. Considering these points, the breeder who is always looking forward to years to come selects his cows and so breeds them that they will calve at the proper time for the calves to show at a good long age. Even then some are better than the rest and the judgment of the breeder is called into practice to pick out the number he needs to show; and this is best done when the calves are about ten days old, for it is safer to believe that if the youngster loses his calf form he will return to it, rather than to rely on a poor calf growing into good form. A good plan to follow is to select two animals at first for each one you desire, for oftentimes the judgment between two animals will be changed as they develop. Then, again, an animal sometimes " goes wrong" and you have another to fall back upon. Later, as the feeding advances, it is an easy matter to pick out the best one of the two animals and the other one can be rejected. In making your selections, lay all prejudices aside, judge your animals as though they belonged to someone else. You must find their weaknesses so you can overcome them through fitting. Select those conforming to one type. Every breeder has, or should have, a clearly defined picture in his mind's eye of the proper type, and his show animals should all tend towards this one type—insuring uniformity. And what pleases the eye of the judge more than to see each entry you lead into the ring resemble closely the one you just led out? When showing in groups the advantage becomes still more apparent.

Character and style, though of little value at the pail and churn, are all important factors in the show ring. Difficult as they are to define, they always pleasingly attract your attention when present and give to the animal a proud dignity of carriage, refinement of countenance and a desirable prominence of features throughout. Their presence is indicative of vigor, thrift, constitution, prepotency and as when found in man, all that goes to make up an honest, reliable individual. But these points are not all; with them go quality, conformation and beauty to make up the winner. Animals beefy in conformation, heavy over the shoulders and through the thighs, with small or badly formed udders and small misplaced teats, though often seen in the show ring, would have better been left in the pasture. Narrow heads, sleepy eyes, small muzzles, shallow barrels, are all indications of poor feeding capacity and are all quite readily noticed by the judge. In fact, to win in the present day show yard, where competition is invariably keen, the dairy animal must conform to the dairy type in the strictest sense, and unless it does, its chances are poor for winning anything more than criticism. When the animals that are to constitute the show herd are properly selected, feeding operations should begin at once to insure plenty of time to place the beast in its best form.

A famous breeder said that all time was too short. This is putting the case rather strong, but the feeder should look ahead to the time when he should have his animals finished, and allow himself enough time to bring his cattle slowly and gradually into bloom by that time. I strongly believe there is nothing, not even breeding, that exerts so much influence toward producing show cattle as liberal embryonic nutrition, followed by careful and liberal feeding from birth to the showing. While the calf is in the embryo state its feeding should begin by supplying the dam liberally with food stuffs rich in protein and ash, as bran, clover hay, gluten, oats, oil meal, etc., from which she can produce nourishment for the foetus.

Preparing Cattle for Exhibition Purposes.

By so doing the foundation is strongly laid; the calf is born strong in bone and muscle with the prepotent characteristics of its ancestors strongly marked, and is soon on its feet starting further development by drawing nourishment that, through the use of nitrogenous food, its mother has stored up in her udder for her infant. On the other hand, had the cow been starved or fed on stuffs rich only in carbohydrates, as is the case with corn, it matters little what possibilities were stored up in the embryo by the prepotency of the sire and dam, they remain in a dormant state for the want of stimuli to start their development, and the calf is born in a weakly, stunted condition, with scarcely enough strength and stamina to draw the first milk, and the calf so seriously handicapped must ever remain nearer the plane of the common scrub than to the plane of the blue and purple winner.

Not a day can be lost from birth to exhibition day if the calf is to compete successfully. No food can take the place of milk, but even this should be fed with the greatest of judgment. The calf should be taken from the cow when about three days old and taught to drink from the pail. Care must be taken from now on to prevent scours, which are the greatest menace to the feeders' skill. A bad case of scours is liable to give the calf a setback of a week or two in its development. The pail from which the calf drinks must be kept absolutely clean and sweet, the milk fed regularly and at the same temperature each time. A teaspoonful of soluble blood flour added to each feed of milk will prove more efficient than anything else in preventing scours and promoting growth of bone and muscle. As a rule, dairy calves must be satisfied with skim milk after the first month of their existence, but this should not be true of the show calf; neither should the milk it receives be too rich in butter fat, but this is a question that must be decided by the feeder and it is an

With the Citrus Growers

A BIT OF CITRUS HISTORY.

A LOOK at California citrus industry given in Citrus Fruits by R. M. Teague is so good, that we quote from it as follows:

Citrus culture in California, like so many other lines of fruit growing, took its inception with the advent of the early Missions something like a century ago. In its beginnings it was sporadic in character,—a few trees of oranges and lemons (more especially limes in the earlier period) that dotted the landscape over widely separated points, usually found an abiding place within the shadow of the Mission Churches or their immediate environs. For the most part they were planted to supply local wants, no attention whatever being given to their culture as an article of commerce. In sort and variety they were also limited, consisting chiefly of the seedling orange and the Mexican lime. This dearth in kinds and sorts was universal—it was as pronounced in the sheltered portions of Northern California, in the great thermal belt of the San Joaquin and Sacramento valleys, as in Southern California. In so far as progress and development was concerned, there was none from the time of the advent of the early Missions and the period of American occupation. Even after that period the advance was slow and purely local in character, representing small plantings of trees in gardens and limited orchards calculated to meet a local demand for fresh fruit. Some efforts were, however, a feature of the late sixties and early seventies, when oranges began to find their way by ocean vessels to San Francisco and other northern points, chiefly from Los Angeles county. These early shipments were usually sent out in bulk, sometimes in barrels, sometimes in sacks, and at other times in boxes. In the northern markets these brought good prices, which greatly advanced the interest in citrus culture and stimulated planting not a little. The first great impetus to citrus growing, however, took its inception when the railroads were completed and made it feasible to ship direct to the Eastern markets.

Citrus culture, as a great force in California's horticultural development, takes its date from about 1870. One year previous to that time, Riverside had already taken the initial steps toward becoming a great orange growing section—a distinction which has been augumented with the years, until it is recognized the center of the industry in the United States. At about the same time many other places were exploiting orange planting. Growing settlements with citrus culture as a basic industry were springing up all over Soutnern California, but chiefly in the San Gabriel valley. For the most part, these early plantings, when coming into bearing, paid handsome returns. In not a few cases as high as $2000 was realized from a single acre, and from $500 to $1500 was not unusual. Naturally an industry yielding returns like this attracted men and money from all sections, with the result that land values increased rapidly and the new acreage, being constantly planted, resulted in a development, the like of which has probably no parallel in the annals of horticulture. A few figures in the rough will tell forcibly the giant strides made in 1890-91, when Los Angeles county shipped 2212 cars and San Bernardino county (then including what is now Riverside county). 1708 cars; 1898-99 when the total cars shipped from Southern California aggregated 15,000, valued at about $12,000,000. Since that period, the advance has been healthy, though not quite so pronounced. At the present writing, the total shipments from south of the Tehachepi range of mountains will average between 25,000 and 30,000 carloads, valued at about $25,000,000.

While this development was going on in the Southern counties, the American spirit of enterprise was not idle in other sections of the State. In the thermal belt of the San Joaquin valley, from the southern portion of Tulare county along the base of the Sierra Nevada mountains, there is a vast area of country adapted to the orange and the lemon. Experimental plantings here and there gave early evidence of climate and soil conditions favorable to citrus culture. Notably true was this of the section of which the town of Lindsay is now the citrus fruit center. As a business proposition, oranges and lemons began to be planted in that locality about fifteen years ago, though experimentally and in a small desultory way citrus fruits were known in that neighborhood as early as 1862-'63. Last year (1906-'07) the shipments from Central California aggregated something like 2000 carloads. For the most part the fruit ripens earlier than in Southern California, thus insuring an independent market which in no way conflicts with the industry as between one section and another. At present there are about 4500 acres in bearing and fully 11,000 acres, both young and old, planted out. The quality of the fruit is in every way superb, clearly indicating that California's sunshine, soil and climate are quite as good in one section as in another. The natural supply of water in that region is ample, and warrants the prediction that at no distant date orange shipments will be as pronounced from that section as raisins are from Fresno.

Besides these two citrus growing empires within the borders of the State, there is also what is known in the trade as the Northern Citrus Belt. For the most part this is somewhat broken up or scattered over several counties, including Placer, Sacramento, Butte, Yuba, Stanislaus, Merced, Sonoma, etc. At particular points in all of the above northern and central counties, there are protected areas free from biting frosts in which citrus fruits find congenial conditions. Thus it will be seen that the orange and lemon, though rated as tropical fruits, yet find a wide geographical distribution in a State which is nothing if not a world unto itself for the growing of almost every fruit of the temperate and tropic zones.

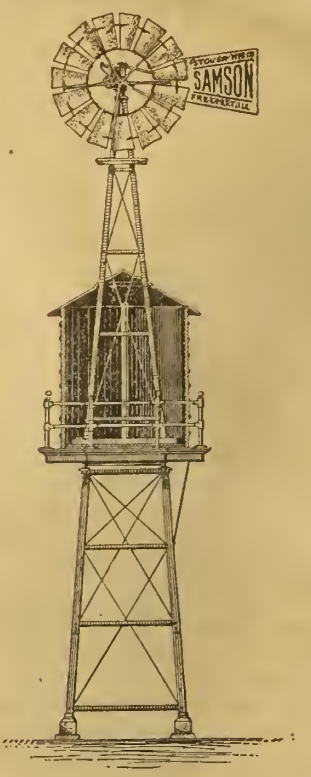
Redlands orange growers are planning for an extensive campaign against the yellow and black scale. Fumigation will be the principal method of work.

All Western Oregon is becoming interested in the good roads campaign, and a large meeting is to be held this month at Portland.

An extensive forest fire in northern Sonoma county and southern Mendocino counties burned for more than a week and did vast damage.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

IRRIGATION OF ORANGE TREES.

From an address delivered some time ago at Riverside by Mr. C. E. Rumsey, we quote the following as reported by the Riverside Enterprise:

"I do not know how old irrigation is, but I do know that cultivation runs back as far as Adam and Eve's time. Irrigation is considered young, but investigation shows us that long before America was discovered the Pima Indians were building irrigation canals in Arizona, living in houses and weaving cotton. Today traces are plainly visible of the early forms of irrigation. So, after all, irrigation is a pretty old art in America. Irrigation has changed this valley into a fertile spot and made possible the wonders that have been accomplished in agriculture.

"Men seem to differ about irrigation as they do on all subjects. One of the greatest fascinations of agriculture is its uncertainty. We must fight nature as we as use it, in spite of the old saying to 'let nature take its course.'"

"I have it from a well-known authority that 25 per cent of the irrigation lands would eventually become worthless because of the lack of drainage. Land must be drained as well as irrigated. Irrigation is running water into land and not running it off as many of us are guilty of. The requirements of irrigation vary. It depends altogether on the lay of the land."

Mr. Rumsey also told of an experiment that was being carried on by James Mills on an orange grove. This grove, when he last saw it, was doing well in spite of the fact that it had only been irrigated once in one year. He declared that it was at the lower end of a mile of groves, and probably the trees grew by an invisible system of sub-irrigation.

"This experiment got some of us to thinking. The question was raised as to whether we were using too much water. Six years ago there was a man who had a chance to get rich, but he did not see it at that time. He had a chance to get at a song some orange groves from Matthew Gage, who only allowed one inch of water to the acre for irrigation. These groves with a limited supply of water are among the best in the country, and this man who turned them down realizes now that one inch of water to every five acres is enough. In some cases I think one inch of water to every five acres is too much.

"There are almost as many differences of opinion regarding cultivation as there are on irrigation. In cultivation men have as many theories as in irrigation. When I first came here, I went around seeking information, and I got it. Everybody seemed to have something different to tell me. Finally I put it all into one pot and formed my own course. Some men would no more give up plowing than they would irrigation. I plow every year myself, and try to plow as deep as nine inches and get eight.

"When I see an orchard where the cultivation is only two inches deep, other orchards where the roots are growing under cement sidewalks, then I think of all the horseflesh I am killing, the money I am wasting in cultivation and irrigation. I am up in the air, I cannot understand.

"Just as soon as I get a theory, I fight it. I think a man should form his theory. I am beginning to think that we can fertilize with great quantities with better success.

"In closing, I would like to warn you to beware of the man who thinks he knows it all. I am as scared of him as I am of the pruner."

AN ENGLISH ICELESS REFRIGERATOR CAR.

A new refrigerating car, the design of two Liverpool experts, has been put upon the English market. The London Times, in describing it, says:

"Up to the present practically no improvement has been made in the ordinary iced box car for carrying perishable produce, a system which has decided limitations. The car now introduced accomplishes the cooling by means of a mechanical refrigeration plant, which consists of a small inclosed type ammonia compressor of special design mounted on one end of the car; an ammonia condenser designed for cooling by the air current produced by the motion of the car and placed on the roof; an expansion valve arranged to keep, automatically, a constant pressure in the evarporators within the car, and consequently a constant temperature therein, and ammonia evaporators, placed in suitable positions inside the car, arranged to provide a regular supply of cold to keep the car temperature constant during stoppages. The compressor is driven from one of the axles by chain gearing, a change speed gear and disengaging mechanism being interposed between the axle and compressor. The driving wheel placed on the axle may be arranged to allow the toothed part to swing in either direction, and thus keep in the same plane as the driven wheel on the intermediate shaft.

"The advantages claimed for this type of car over those now in use are that it is independent of any ice supply whatever; it is available at any point on the line and at all times; it obviates delays due to icing, and, in addition, the expense attaching to ice storage and filling; it effects a lower temperature than is possible with ice on a journey without renewals; and it is free from the risks due to careless or insufficient icing."

FUMIGATION IN THE NORTHERN COUNTIES.

Citrus growers in Glenn and Colusa counties have been fumigating for the yellow scale, which is a very serious pest on the orange trees of that section, and now the olive growers at Fair Oaks, in Sacramento county, are arranging to fumigate for the black scale. This pest has been increasing in numbers for several years past in spite of the establishment of numerous colonies of Scutellista cyanea, and some of the growers there have made up their minds rather to resort to artificial methods than depend longer upon parasites. At the present time the hot weather has checked the spread of the scale and the work will be largely preventive, it being hoped that fumigation will kill off all the young scale that have escaped the sun's heat and so check its further spread.

Do Irrigation Work---Quicker and Easier

For Leveling Fields—For Cutting and Clearing Laterals

The photo is from an actual field-scene in New Mexico, where a 20th Century Grader is leveling seed-beds on the great truck-farm of Herman Blucher. He says: "Your 20th Century Grader has no equal for land-leveling, seed-bed making, ditching and for all kinds of irrigation work. I have reduced my force one-third since buying this machine." The

20th Century Grader

weighs only 600 lbs—light and handy—and is easily handled by one man and two horses. It is all steel and malleable iron. Price very reasonable. It pays for itself in one season. If your dealer hasn't it ask for name of nearest agent. Write now for new free booklet with large cuts showing every part.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

GRAFTING THE PEACH.

The peach, when grown upon peach-roots, is more often propagated by budding than by grafting, says the Kansas Farmer. Budding is carried on in July and August upon stock grown from seed during the season. It can be done rapidly and, under proper conditions, gives better results than any other method of propagation. Grafting, however, frequently gives satisfactory results. The most satisfactory way is to graft in the spring, at the time when the sap is beginning to flow. The stock upon which the graft is made should be of the previous season's growth. Remove the soil to the first roots and cut off the tree an inch above them. This method is known as the cleft graft. Make a sloping cut from the roots at such an angle that it will remove about half the surface of the horizontal cut. With a chisel or sharp blade split the stock at right angles to the cut that has just been made. This cleft should extend about an inch, or down to the roots.

The scions should be cut the previous fall or winter and stored in moist leaves in a cool, dark cellar. This will keep them in a dormant condition till the time for using them. To prepare the scion for grafting, take about eight inches of the terminal growth, making a wedge at the lower end an inch in length. This wedge-shaped part should be thicker on one side than on the other, and it is better to make the cut so as to include a bud near the upper portion of the thicker side of the wedge. Insert the wedge of the scion into the cleft of the stock, with the thick part of the wedge toward the side of the stock in which the bark has not been cut away. See that the cambium or growing part of the scion fits exactly to the cambium of the stock. Push the scion down into the top of the wedge-shaped cut even with the top of the stock. The shape of the wedge is such that the cambiums of the two parts will be held firmly together. Cover the portion with wax and draw the earth over it. The scion soon opens its buds and begins rapid growth. A good grafting wax for outdoor use is made as follows: 4 ounces of resin, 1 ounce of beeswax, half a pint of raw linseed-oil. Melt all together gradually and turn all into a pail of cool water. Pull until the color becomes light, make into rolls, and wrap with strong oiled paper. These rolls can be laid away and used at any time.

The apricot is gratted upon the peach in precisely the same way as has been described for the peach.

METHODS OF INDUCING FRUIT BEARING.

It isn't often that the fruit grower is concerned about his fruit trees not setting fruit, as the general tendency of most varieties is to overbear. There are some varieties, however, which are slow in coming into bearing, and individual trees of standard varieties sometimes fail to set fruit.

Horticulturists have for many years practiced various methods to induce fruitfulness and with some degree of success. All these methods, as girdling the trunk, root pruning, and summer pruning of the branches temporarily check the growth of the tree, and the consequent slow growth induces the formation of fruit buds. It is well-known that the buds which produce fruit in any particular season were formed the season before and their formation is believed to begin early in the growing season This being true, the time is now at hand for such work; if put off much later in the season, it will be too late, as the time for the formation of fruit buds for next year's crop will soon be passed.

By root pruning is meant that a small portion of the roots are cut off, and the operation may be performed with a spade or in any way which is best suited to individual needs.

Summer pruning takes the place of the annual winter pruning, and is the same in most respects except that it is done in June instead of winter or early spring.

Girdling or ringing consists in removing a ring of bark from the trunk or larger limbs. This ring is sometimes two inches or more in width; all the bark within this space is removed, thus exposing the wood. The method of checking growth, though often employed, is rather drastic, and should be used with caution. A more rational method is to girdle the branch or trunk by cutting through to the wood by making one continuous cut and not removing any of the bark.

Some authorities state that the proper time to check the growth of a tree in order to induce the formation of fruit buds is at the time when the bark begins to set on the new growth. As this is rather a delicate feature to determine the average person will make no mistake if he does this work any time in the fore part of June.—W. Paddock, Horticulturist, Colorado Experiment Station.

UNSEASONABLE BLOOMING OF TREES.

It is not uncommon for fruit trees of all kinds to bear flowers in late summer or in the early fall. This tendency is more marked in the semi-arid regions than in the humid states, but the explanation is simple.

One writer reports an instance where a pile of weeds was burned underneath an apple tree. The heat from the fire was sufficient to shrivel the leaves to the top of the tree on the exposed side, but it did not otherwise injure the tree. This was in August, and a month later the tree came into bloom on the parts which had been injured.

This result was probably due to the drying out of the buds by the effects of the fire, an effect similar to that produced by the low temperature during the winter months.

In a somewhat similar way a lack of water during the middle of the summer causes the buds to dry out and to become mature. Then, if water is applied later, second growth starts in and some of the blossom buds unfold.

These unseasonable flowers do not often set fruit. However, fine specimens of the Red June apple were received at the Agricultural College last November. These specimens were picked in an orchard in Utah from trees which produced a normal crop in June. Some weeks later the trees put forth a partial second crop of bloom and a few fine specimens matured.—W. Paddock, Colorado Agricultural College.

SQUIRRELS AND GOPHERS.

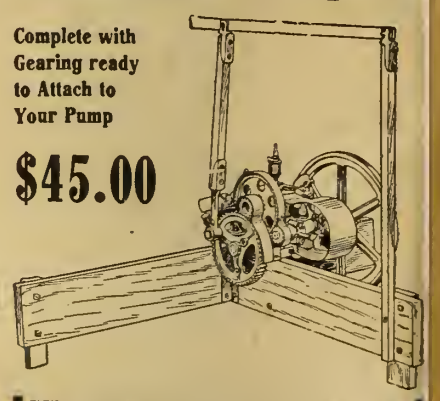
Both ground squirrels and pocket gophers are known as gophers, a name which should be properly applied only to the latter animals. The ground squirrels are so called because, unlike the tree squirrels, they live upon the ground and have their homes in burrows in its surface. There are several kinds of these in different parts of the State, and they are usually gray or striped. They subsist chiefly upon seeds and grain, though insects compose not an inconsiderable portion of their diet. They may be killed by the use of poisoned wheat in spite of the popular opinion that "gophers fatten on it." The following formula has been used effectively in Kansas:

Dissolve one and one-half ounces of strichnia sulfate in a quart of hot water. Add a quart of syrup and a teaspoonful of oil of anise. Thoroughly heat and mix the liquid. While hot, pour it over a bushel of clean wheat and mix completely. Then stir in thoroughly two or more pounds of fine corn meal. There should be just enough to take up the extra moisture. Let the wheat stand over night and distribute next day, placing a few grains at the mouth of each burrow. Two or three applica-

Aermotor Gasoline Engine

Complete with Gearing ready to Attach to Your Pump

$45.00



Will pump all the time, wind or no wind, and deliver as much water as an 8 ft. Aermotor in a good wind.

From 225 to 1600 gallons per hour, depending on height water is to be raised.

Air cooled, uses Gasoline or Distillate.

A reliable, durable engine at a very low price. Can You Afford to be without one.

tions may be necessary before the field is rid of squirrels. The poisoning must be done during the summer, because the animals hibernate in winter and the poison is only wasted.

Pocket gophers live almost wholly in the ground and feed upon the roots of plants and trees. The poison recommended for ground squirrels is excellent for these animals. It must, however, be put in the burrows. They may be opened with a spade and a few kernels of poisoned wheat dropped in, leaving the hole open. An excellent tool for opening the holes is made by putting a sharp steel point on the end of an old spade handle. This may be thrust through the ground into the burrow and the wheat dropped through the hole thus made. If poisoned wheat does not prove effective, substitute corn.—S. Arthur Johnson.

HOW TO CUT SCIONS.

It has been demonstrated by the most successful fruit growers that the scion from which a tree is grown has much to do with its productiveness when it approaches the bearing age. Much has been said and written concerning the value of a hardy root for the trees in our orchards, but, in my opinion, scions from productive annual bearing trees are fully as important to the orchardist.

These can be cut any time in the fall after the wood is fully ripe and the buds well healed. This occurs when the leaves fall and the buds are exposed for a time to the air, which so hardens them that no loss of moisture will occur through these natural outlets during the dormant periods.

Select vigorous, hardy, disease-resisting trees for your scions. They should also have established the reputation of being annual bearers, producing fruit of high quality. We believe these characteristics may, in a measure, be intensified when great care is exercised in selecting the scions which are to be used in making the root grafts. The same principle also applies to the top-working of the fruit trees.

PICKING PEARS.

As most pears become thoroughly mellow only after being removed from the trees, some difficulty is experienced in getting them into a marketable condition without letting them decay. The weather is so warm during much of the pear season that all of the injured fruit decays very rapidly. If, however, care be taken not to pick the fruit until it is thoroughly mature, and to handle it very carefully, much difficulty may be avoided. Varieties differ very much in the length of time required for mellowing after being picked, and in the perishableness of the fruit, some quickly becoming ready for eating, with little loss, and others mellowing so slowly that a large percentage decays before they become palatable.

ARGENTINE ANT.

Prof. H. J. Quayle of the Experiment Station force located at the Pathological Laboratory at Whittier, writes that he has taken the Argentine ant in Southern California at Uplands, Azusa and Los Angeles. At Uplands and Azusa it is distributed over about one-quarter of a square mile of citrus orchards, and over four or five blocks square in the city of Los Angeles, around Tenth street and Burlington avenue.

The seventh annual convention of the National Nut Growers' Association will be held at Chattanooga, October 27-28-29, 1908.

A Free Sample of This Perfect Fish Fertilizer for Every Reader of the Cultivator

Every manufacturer who desires to sell his product to the farmer ought to be willing to let that farmer try his goods in a small way to find out whether or not they are what they are claimed to be. At least, that is the way we feel about it. And for that reason, we offer to send you a sample of WILGROW absolutely free—not one cent of cost to you. All we ask you to do is to send us the names of three of your neighbors and the name of your local dealer.

What Wilgrow Will Do

It will feed everything in plant life.
It will double the crop of tomatoes.
Roses thrive on it.
Oranges and lemons just love it.
Celery grows crisper and in greater quantities.
All flowers take on an added beauty and bloom in greater profusion.
Cauliflower responds quickly.
Berries of all kinds are more luscious and plentiful.
The yield of radishes, onions, lettuce, parsley, carrots, parsnips and all other vegetables is greatly increased and their quality much improved.
We would like to have you prove these claims.
Will you send for your free sample today?

What Wilgrow Is

It is a scientifically prepared plant food.
It is not a medicine for plant life.
It is made from fish guano, but so prepared that it will contain just the right percentages of the different plant foods.
It is a concentrated plant food, and is put up in the most convenient packages for its distribution.
A 25c package contains as much plant food value as a large load of barnyard manure.
The 25c package is especially adapted for use in flower gardens, small vegetable gardens and lawns.
Our 25-lb. bag is for field use and does away entirely with the expense of big machines to distribute it or the time of horses that could be well spent at other work.

Bees and Their Care

SUCCESSFUL MANAGEMENT OF APIARIES.

The most important factor in this line of work, I believe, is to be done in cleaning of frames, bottom-boards and hives in general. See that all colonies have queens and how brooding is progressing. In cleaning hives, etc., it has always been easier to have an extra hive body and bottom-board. The first thing is to set empty hive down, then proceed to clean frames and place in the empty hive body. In this method I find we kill less bees and work faster.

The next time around we spread brood. That is, for those colonies that need it, and it has been my experience that nearly all colonies with brood on or in four frames need it, if there are enough bees to cluster on six frames. I generally give them one comb in the middle, then place pollen frames on outside of brood nest, and on each visit to the yard thereafter, I spread likewise. After first spreading I always piece the comb containing eggs and larvae on outside of sealed frames on brood, so in case of any chilling it will be better for the colony to lose the larvae than the brood, as we are working for young bees to help rear more brood, and as a rule, queens lay in combs between hatching brood better than they do between combs containing larvae and eggs. Now as I have described brood spreading I will describe equalizing. It is my opinion that it is the best policy to hold up strong colonies by help from the weaker ones. Of course, if you have plenty of time to stimulate brood rearing and if your strong colonies have eight to ten frames of brood from the strong ones, place the empty frame in middle of brood nest of the strong colony. We will now suppose all colonies are ready for the flow. We begin supering by giving one super with a bait comb, and if the flow is late in arriving, as in the past two seasons, and colonies commence building cells and preparing to swarm, if increase is wanted, we draw two combs of hatching brood and queen cell and start a nucleus, inserting in their place frames containing full sheets of foundation, thus preventing them from building drone comb, and nine times out of ten preventing swarming.

If no increase is wanted then cut cells, and if there are any weak ones in the yard do some more interchanging of brood for empty combs.

After flow is on, super where needed. Never super a colony that has no need for it. When supers are two-thirds or nearly two-thirds finished place a super under it, and so on through the flow.

In some cases where you draw two frames of brood and it does not check the swarming fever, then shake them on full sheets of foundation, and if the queen is very prolific give one comb of hatching brood and one frame of larvae. Select larvae, if possible, too old to start queen cells from. This plan has never failed to quell the swarming fever, and I have never had a swarm to go out.

When taking honey one man shakes the supers and another man carries and stacks them up.

After this, super colonies as if expected another flow.

The most essential thing in successful beekeeping, whether out of apiaries or not, is the quality of stock, good prolific queens. Holy Land or Three-Banded Italians mated to Golden drones are my preference. M. O.

BEES AND FRUIT GROWING.

A very valuable line of work, and one that dovetails in with fruit growing perfectly, and more profitably than any other one thing that I can think of, is the production of honey, says Z. L. Sutton in the Farmers' Home Journal. Anybody whose capital is limited and area of land small, can soon build up an independent business with fruits, chickens and bees. It is perfectly marvelous what can be done on a few acres of ground when put to such uses as here suggested. In fact, every farmer who grows any fruit of consequence should have a few hives of bees, and even if they have no fruit, there is nothing else on the farm tnat will yield a greater revenue than a few hives of bees. "The bees should be in first class patent hives to pay," when managed properly.

Besides the honey and profit, there is another reason why the fruit will find the bee a helpful business associate. Every fruit grower ought to know how important it is that all forms of plant life be perfectly pollinated, if it is to bear its full, its particular fruit. Undoubtedly the bee performs this function better than any other insect. As he gathers the nectar of the fruit blossoms, he loads himself down with the fertilizer pollen, and as he moves from flower to flower he carries this essential element on wings and legs to be absorbed by the pistils of the neighboring blooms. Until this last year or two I was afraid of bees, and would not go near them, as they would sting me on the slightest pretext, but being engaged in growing all kinds of fruit, and believing that a number of colonies of bees would pay for themselves in one good fruit season, in helping to pollenate the bloom, I determined to buy a lot, even if I was afraid of them. Last spring, 1907, I bought forty good swarms, and all that were in old-fashioned box hives or logs I transferred into the very best make of patent hives. I bought a good bee veil, bee gloves, and the best book on bee culture that I could find. I was considerably nervous at first, but soon got so I could do most anything with the bees, and before the season was gone all fear of the bees had vanished and I enjoyed working with them more than any other work on the farm.

RESULTS—Last year was an off fruit year with nearly every one in my section of Kentucky. I had the finest crop of strawberries that I have ever had, with the poorest prospect to start with in the spring that I have ever had. More strawberry bloom was killed by frost for me than ever before, and I did not think I could possibly have over half a crop. Every late bloom was thoroughly worked over and pollenized by the bees, and every berry was large and perfect and brought top prices. I had no nubbins to sell for half price. From less than two acres of ground I sold $525 worth of berries, and I believe the bees acount for anywhere from $100 up to one-half of the $525. I had a peach orchard close to my house and the bees, that was loaded down with as fine peaches as I ever have had. My apples were better than usual, and all the trees loaded with apples on my home farm where I have the bees. I have an apple orchard on another farm where there are no bees, and the crop of apples was very light in that orchard. My table has been supplied with honey "the healthiest and purest sweet on earth," every meal nearly, for a year, and I have given the sick and friends a number of pounds, and my book account shows a surplus of over $200 worth of honey sold and on hand. I consider the investment in forty hives of bees to be as good as in forty good Southdown ewes, with a great deal less trouble, merely for the surplus honey and swarms of bees, and not estimating the value to fruit bloom. I now have fifty-five hives, and could sell the whole lot at $5 per colony.

Bees pay well for the money, and to the fruit grower their value is inestimable.

BEESWAX.

Many people still think that bees gather wax from somewhere just as the wasps gather the fibrous stuff from wood from which they construct their nests. No greater mistake ever existed. The bees in a sense do gather wax, but it is from each other. The wax of bees is like the butter of cattle, yet the production is quite different. The butter of the cow comes from the milk and the whole from a gland. Just so with the bee. There are eight glands on the under side of a bee's body which secrete and exude wax. It is claimed that this wax in its first form as discharged by the gland is quite thin, with great evaporating power. This fluid substance adheres to the eight scales on the under side of the bees and evaporates and leaves a scale of wax This is gathered from the bees and carefully woven into the delicate combs in which they store their honey. No churning process is needed with the bees' wax.

At a recent meeting of beekeepers in the Yakima valley, in Washington, Jesse Thornton read a paper on the marketing of honey, in which he described the different grades known to the market as follows:

Fancy honey should have all sections containing well filled combs, straight and firmly attached to all four sides, unsoiled by travel and stain or otherwise, and all cells sealed except the row next to the wood.

No. 1 should have all sections well filled, but might contain crooked or uneven combs, detached at the bottom or with but few cells unsealed and as free as possible from travel stain. The section should be scraped clean from propolis.

An exchange says: The busy bee has the laugh on the department of agriculture. "If it is so foolish as to work all summer at making honey in order that it may have something to eat during the winter," suggested one wise inspector, "it would work all the time down in Jamaica, where they have 365 days of summer." Secretary Wilson accordingly ordered that some of the government's liveliest bees be taken to Jamaica, escorted by a half-dozen watchers. For several months the entire outfit has been in the West Indian Island, and a few days ago the following message was received by the department: "Nothing doing. Bees are on. No winter here, and they struck on honey-making as soon as we arrived."

Live Stock and Dairy

HOT DAYS.

THE Fresno weather man has gone East to sell patent rights for frost alarm clocks and smudge pots. The weather is running away with itself. The temperature is high and the mercury is trying to climb out of the top of the thermometer to seek a cooler place to rest. Frost alarm clocks sounds good! It sounds cool! The only frost or coolness just now is found in the refrigerator! How little man or beast suffers in California when the thermometer runs up in the 100s, 112, 113, 114, 115, 116—five days of sizzle, yet the work never stops for the heat. The Chinamen hoe Johnson grass and morning glory. The teams spread out the raisin trays or haul in the malaga grapes to the packing houses; neither man nor beast collapses with the heat.

Cultivation.

Fruit lands that have received careful cultivation show up this year in the greenness of the foliage. It is standing the blistering sun better than the leaves on plants on the rough cloddy soil. For a number of years past the Bermuda grass is growing its rankest. There is a fraction under seventeen acres as measured in the survey, in the Bermuda field known as the triangle. On March 5th eighteen heads of horses and sixteen head of two-year-old heifers were turned into this field. On May 20th the stock was taken off long enough to flood the land. After a week twenty-two horses, eight colts and twenty head of cattle were placed on it. During July the teams not needed for work were turned into it until it carried eight head more. These animals were all fat and in high condition when taken off the pasture on July 28th. As soon as the land is again well watered they will go back on it and we will expect it to keep them for six or eight weeks longer in prime order. Truly, Bermuda grass is a blessing in a dry year like this. We have a number of small lots of Bermuda that do equally as well but will not stop to tell of them. Right here I wish to say, do not plant Bermuda grass, but if you have it, do not despise it but use it to its fullest feeding capacity. Make a blessing out of misfortune.

DIPPING SHEEP FOR SCAB.

the idea of saving expenses of plowing has gained vogue. The vineyards this year that have the best crops are those that were plowed both ways and then cultivated well. Some well cultivated vineyards are slightly burned but the entire foliage is not cooked and withered. It seems a pity for the season has been exceptionally free from mildew and pests. Nearly every vineyard shows spots that have fully a third of the grapes cooked on the vines.

Cows.

It is surprising how well the cows are holding up in their milk, only a shrinkage of 5 pounds a day per cow. Today they had their first sorghum; the heavy wind of Friday laid low some sorghum and we cut it for them. They relished the change from cut alfalfa. Shorty says "they smacked their lips over it." The heat out in the fields is too great for the cows, and they are allowed to stand in the small well filled ditches in the cool water under the dappling willow shades, to ruminate until the cool evening breezes blow fresh and sweet. They are fed freshly cut alfalfa, for it does not pay to let them wander far in the intense heat for a full stomach.

Bermuda Pasture.

The hot summer never proves too much for these pastures. When the alfalfa shortens in its growth, until it blooms when less than a foot high,

Sunshine.

The sunshine makes the corn grow rapidly. The Indian corn is now in full tassle and bees are singing their sweetest as they gather around it. The sorghum is beginning to head out. We thought it would have been in the silo before this time. The cool weather was hastening it to maturity. Then the weather broke loose and the sun gathered himself up and hurled heat down on it. The corn almost seemed to be pulled out of the ground. It stretched up rapidly, grateful for the warmth. It has stretched up and up—tip-toeing to reach the sun. How much taller will it grow? The poor little morning glory in the sorghum field once was a power but now it looks very wan and tired of living. Life to a plant without sunshine is like life to a man without a belief in a God—something without much value.

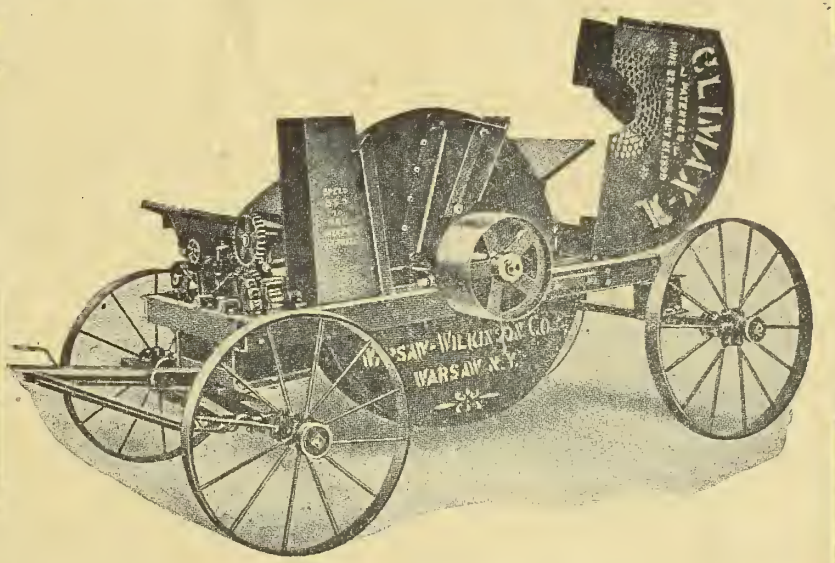
Alfalfa.

While I am praising Bermuda grass and corn do not think I am regardless of alfalfa. The wealth of the dairyman lies in alfalfa, for it furnishes his protein and succulency in the small package. It has a greater value pound for pound in feeding than ordinary bran. It must be balanced with other foods rich in flesh forming matter or animals will grow thin eating it. It is very like the Salsbury treatment for the human family of rare beefsteak for obesity. Balance it with barley, corn or other foods and its value is found out. This season the man with a good alfalfa field has a treasure as a revenue producer. Hay in the barn costing $11.00 a ton—hay that two or three years ago would have been dear at $5.00 a ton. Why? Because the dairy cow has come to her own all over the valley. She is known to be the wealth producer. It is only a few years ago that I used to purchase alfalfa hay cheap enough to use for fertilizer. Now, with corn to balance the alfalfa crop, the dairyman and stock raiser must study to hold the cattle and the feed in balance. A few extra head of cows or horses will often make the difference between profit and loss. Whenever it is necessary for a breeder to buy hay for his stock, then it must be exceptionally valuable to pay any returns. Alfalfa hay stands today the cheapest feed we can grow for stock. A stand of alfalfa well cared for is good for twenty years or more. After the first year it will make from 8 to 10 tons of hay to the acre year after year. Oranges, grapes, peaches and olives are all profitable on the ranch, but for real pleasure in country life, give me the cattle and horses. They fill the eye. They give beauty to the landscape.—M. E. Sherman.

Berkshires--Shorthorns

My Berkshires took every blue ribbon and Gold and Silver Medal in the female classes. Choice pigs at low prices. G. A. Murphy, Perkins, Cal.

Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

O. J. Weber Co. 555-557 South Los Angeles Street Los Angeles, California

FLYFOE

That is just what it is. Sprayed on stock it kills or keeps off all those awful pests, flies, mosquitoes, gnats, etc. Do you realize what that means? Use it and note how much easier it is to keep your stock in condition and how comfortable they are. Sprayed on your cows the increased milk yield will many times pay for its cost. You should use something of the kind and

FLYFOE

will be found the most effective "fly bouncer" on the market.

If your dealer does not keep it, we will ship a 1-gallon can at $1.25 or a 5-gallon can for $5.00, and will prepay the freight. If not fully satisfied with it money refunded. Made by the

PREPARING FOR EXHIBITION.

Continued from page 147.

easy matter for him to blend skim milk and whole milk in such a manner as to induce greater development of framework and yet retain enough of the butter fat to give the youngster an appearance of health, thrift and beauty.

Never wean the calf until after the shows are over, for after a long journey, when surrounded by strange environments, nothing will tempt the calf and keep him in shape like lots of good, sweet milk. When about two months old the calf will begin to crave for some solid food; then bright clover or alfalfa hay, some green food and a light grain ration, such as will be described later, will add to the welfare of the youngster. A box containing salt and a lump of chalk should always be kept within reach of the calf. Chalk regulates the digestive tract and assists in eliminating the dangers of scours. By all means allow the calf plenty of bulky food, sunshine, exercise and dry, well bedded sleeping quarters.

In feeding older animals the science becomes more of an art and the feeder has many problems to consider. All that can ever be said or written will not make feeders unless good care and judgment is used on the part of the feeder himself, and in no other calling. is judgment more necessary.

Cows, two year old heifers and yearling heifers that are to be shown in milking form should be selected and bred ten months before the first show of the circuit. Many exhibitors, however, do not follow this plan and very frequently we find cows freshening on the circuit. It is very difficult to give these cows the attention and quiet surroundings on the fair grounds that they would receive were they at home, and many times ill results follow. Further than this, it is almost impossible to get the cow into proper form and hold her there for a long circuit of fairs that are to follow, so that although she may show to a distinct advantage at one or two fairs she is quite liable to be found losing her laurels before the shows have finished. Taking these facts into consideration, it becomes apparent that all animals to be shown in milk form should freshen a month before starting for the shows. If the cows have been producing heavily during the year and are emaciated and out of condition, they should be turned dry at least two months before parturition, when feeding should begin. In carrying on his operations, the feeder should be governed by the following facts and furnish foods acordingly:

1. The campaign which the cow is about to enter will be a strenuous one and will demand all the strength and power that the cow commands. For the purpose of storing up energy, strength and stamina, oats are a most excellent food and should form a large portion of the ration.

2. It is much easier to eliminate or retain fat upon the body of the cow after she freshens than it is to gain it. For the purpose of storing up fat to be drawn upon later. feeds rich in carbohydrates, such as corn silage, corn meal or hominy feed, in limited amounts may be used.

3. All judges admire a large, distended barrel because it indicates greatness of feeding capacity. Such barrels cannot be produced in a week or a month, even though the cow is naturally excellent in this respect. To induce perfection in this respect, large amounts of palatable food, such as clover, alfalfa hay, green corn or clover, silage or roots should be fed continuously. Neither can a thick, hard hide covered with long, harsh hair, which is the result of last winter's hard work and exposure, be quickly converted into a soft, pliable, oily hide with soft short hair in a few weeks. Ground flax seed and oil meal added in small amounts for three or four months prior to freshening, however, will tend towards marked results in this respect.

4. These foods are all rather hard on the digestive apparatus, which no doubt has already been taxed to its utmost during the preceding period of lactation. To rest the digestive organs and counteract any ill effects that other foods might have, nothing can take the place of good bran.

Summing up, then, we find that a ration made of oats, corn meal, oil meal and bran, supplemented with roughage of a palatable form is quite efficient during the dry period. As calving time approaches, the grain ration should be gradually lessened and for three or four days preceding and following parturition, mashes made up of ground oats, bran and oil meal mixed together with warm water will bring best results. After the immediate effect of calving is past, another system of feeding must begin.

This time the object in view is to remove some of the fat from the body and stimulate the largest possible milk flow. Roots, green foods and feeds rich in protein, such as gluten feed, bran, oats, oil meal, etc., may all be used to advantage. When the cow is first changed from mashes to food of a more solid nature, the amount should not exceed 5 pounds. This should be increased slowly and gradually and there is no better plan to follow than to increase the ration one-half pound every other day. This seems slow procedure to most feeders and were I asked to give what I considered the greatest secret in successfully bringing a cow into the best possible condition and to the point where she would produce her greatest possible amount of milk and butter it would be: Start the cow after freshening on a small ration, never increase her feed oftener than every other day and not more than one-half pound. With a fresh cow in fleshy condition, with her maternal instincts stimulated to their highest degree, as they are during the first thirty days after giving birth to her offspring, there will be as great response to an increase to half a pound of grain as to five pounds.

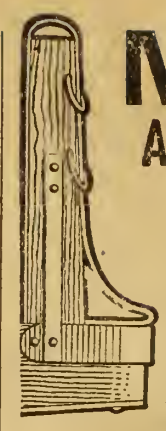
A few other advantages of this plan are as follows:

1. The danger of over feeding is reduced to a minimum.

2. The digestive apparatus is given due time to recover from the weakening effects of parturition.

3. The feeder is given time to study his charge and to determine the character of feed demanded by the cow.

This last point is of great importance, because upon the feeding of the cow after freshening depends largely the condition of the cow when she enters the show ring. Every beast reserves the right to retain its own individuality, so that no fixed rules can be laid down to cover all cases. If the cow refuses to milk off the fat from her body, foods rich in protein can be used to increase the ration to stimulate greater production, but if she shows indications of milking too



MICA
AXLE GREASE

adds years to the life of a wagon. Just what a farmer, teamster or drayman needs to make the "wheels go round" with least wear and most profit.

Poor grease cuts the boxes out of your wheels — don't use it — get Mica Axle Grease and save the wagon.

Mica Axle Grease has just the right "body" to wear long without running. Coats the axle with an anti-friction surface of powdered mica which is almost as good as roller bearings.

Your wagon needs Mica Axle Grease — ask the dealer for it.

heavily and of becoming emaciated, the increase should be of foods richer in carbohydrates or fat producers, to encourage the retention of some of the fat of her body. It is a much simpler task to show animals that are not to be in milking form, because they may be carried on steadily and gradually with foods (before mentioned) which tend to produce growth, condition, softness and oiliness of hide and hair without interruption.

Hand and hand with feeding goes care and management, and it matters little how skillfully one is supplied if the other is lacking—only poor results follow. During the summer months, when heat is severe and flies are pesky, the show animals should be kept in a cool, darkened but well ventilated barn, with stalls well bedded, in the day time, and turned to pasture during the night to graze and exercise while the flies are absent. Daily grooming of a thorough character with a soft brush and a flannel rag, saturated in a mixture of equal parts of coal oil, glycerine, tanners' oil, pennyroyal, carbolic acid and sulphur tends to bring the oily secretions and soften up the hide and hair and keep away the flies. If allowed to run in the hot sun all summer only a hard, harsh hide and sunburned coat can be expected. Thirty days before showing, it is a good idea to clip short all hair on the belly and udder. This brings into pleasing prominence the mammary veins and milk wells. Extra hairs over the shoulders, neck or tail head that mar the looks of the animal should also be carefully trimmed off at this time.

As show time approaches there are many details that demand the exhibitor's attention. Always have your charges well broken to lead and stand while being shown. Nothing is more embarrassing to the exhibitor and disgusting to the judge and observers than a wild, unruly calf in the show ring, unless it is one that stands in that position which shows nothing but its weak points. The horns should be trimmed and rasped into proper size and shape, and horn covers provided to prevent them becoming scratched up. Animals whose feet have grown into improper shape and sizes, which is often the case with aged bulls, should be placed in stocks and have their feet trimmed into shape so the beast can walk to best advantage when presented to the judge. When these smaller details have been attended to the animals are ready to prepare for shipment.

Reduce the grain ration two days before loading, substitute bright hay and omit entirely the last feed, or substitute a bran mash. Unless the shipment is very long, good, bright hay will suffice for the older animals and they will unload in better form than though grain had been fed en route. The calves, on the other hand, should have their milk regularly but in lesser amounts than when at home. If grain is fed on the train or just before loading, the excitement and jar of the car often produces indigestion, causing the animals to bloat and great troubles result.

If the weather is hot, water must be supplied in limited amounts on the car. Take feed and roots with you for they are expensive on the fair grounds and often difficult to buy at any price. On unloading do not allow the cattle to gorge themselves with strange water. Feed lightly the first day, and nothing is better at this time in relieving fever and freshening up the travel-sore beast than a good feed of roots. You should arrive on the grounds three or four days before the day of the cattle show and have your charges well upon their feed and showing at their best at this time. Exercise them regularly and have them well on their feet; take them to the arena before the show and find a good place for them to stand. All animals must receive thorough grooming and have their coats laying in a sleek condition.

At last, the time to stand before the judge has come. All horns are polished, feet trimmed and cleaned and no stone left unturned to make the animal win. If you are confident you have an outstanding winner, get to the ring before anyone else and get the eye of the judge from a distance. He thereby takes in the whole contour of your beast at once and receives a favorable and lasting impression. If you know your animal's weaknesses are apparent, let the others enter the ring first and then get right close to the judge and in the thickness of the fight he may overlook the deficiency.

No blame can be attached to the herdsman who can successfully cover up a fault. That is part of his business, but he should take care that in covering up one he does not produce two. It is seldom that the herdsman can improve on nature and with a shrewd judge it is often better to place the beast in his natural position. Keep on the same side of your animal as the judge, keeping your eyes on both. Have your beast's feet well under him and showing at his best. You should have him so trained that he will stand quietly in his most imposing position, making showing an easy task.

When a long circuit of fairs is to be made it is a very difficult task to hold the animals in bloom and have them fresh at each show. Always keep a good supply of roots on hand and feed lightly of all hard, heating food stuffs. Exercise freely, keep your stalls well cleaned and bedded. In this case the extra expense of a palace car will more than pay for itself in the added good done for the cattle.

When the last show is over, the attendants and herd are glad to return home, for the trip has been a trying one to man and beast; but on arriving home the herdsman's duty is not yet completed. He must cool out his cattle so they can be fitted for another year in a fresh condition, or remain at home as successful breeders. On the carefulness with which the cattle are cooled out depends the future usefulness as much as it does on the care of fitting. All corn and feed of a heating nature must be removed from the ration, the cattle turned to grass if it is during the pasture season; otherwise succulent food and exercise must be given. Of course the ration must be reduced gradually. A few doses of raw linseed oil helps to clean the digestive tract and in due time the animals are down to a breedy condition and ready to respond to another year's fitting.

If you have won with your cattle, you have achieved the success for which you have been laboring; but in case you have been defeated, lay aside all prejudice, and profit by the lessons of the show; find your mistake rather than abuse the judges; and above all do not get discouraged but resolve that in profiting by your mistake, you will try again and success will eventually crown your efforts.

Discussion.

The Chairman: Does anyone wish to ask Mr. Van Pelt any questions?

Member: What would you do in the case of a little calf that will scarcely drink milk?

Mr. Van Pelt: That is a very difficult task. If you cannot get the calf to drink milk, it might be better to place it back on the cow. It is a question whether you can teach them to nurse. I believe if it is possible to get the calf back on the cow, that it is the thing to do; but if it is not, it is a question whether the animal will show to the best advantage.

Member: I notice some exhibitors wet grain before they feed it. Is that right?

Mr. Van Pelt: I would rather feed it in dry condition except for bran mashes. For instance, in parturition time cows need something tempting to their appetites, something that places their bowels in a laxative condition, then I would feed bran mash.

Prof. Van Norman: You need it hot in making a bran mash, do you not? Don't you think it advisable to use hot water?

Mr. Van Pelt: Oh, yes.

Member: Would you use a woolen blanket to protect the cows?

Mr. Van Pelt: I think not, they are too heating. In the summer it is well to keep the animals in the barn out of the hot sun. The last thirty days before the show begins I think the animal should be blanketed, and the blanket should be composed of cotton flannel. Simply the commercial cotton flannel would be preferable to the all wool blankets because they do not retain the animal heat so much.

Member: It is claimed by some that the cotton blankets retain the moisture while the wool blankets will let the moisture out.

Mr. Van Pelt: My experience has been that the moisture, which has accumulated in the blanket, is, in a way, quite advantageous to the coat. Softens the hair and hide. In fact, in breeding animals to grow a long glossy coat the practice followed is to spray the animal before the blanket is put on. Each morning the animal is again sprayed and the blanket put on so in the course of time you will get a glossy coat.

Member: You said it was practically advantageous to feed the animals nothing but hay while in transit. From my experience, my cattle have a better appetite on the train than any other place.

Mr. Van Pelt: That is probably true, but one is running considerable risk in feeding on the train because as I say the animals become excited by the jarring of the train, except of course where they are accustomed to shipment. That would make a difference, but on starting the herd out, in the early fall especially, I would prefer the hay.

Member: I think you are correct for people who make only one shipment, for instance to the State Fair.

Mr. Van Pelt: Another thing, even though sickness does not follow the animals consuming a quantity of feed on the train, when they are unloaded they do not have the appetite they otherwise would and do not come to form as they otherwise would.

Contents

SHADY GLEN IN THE MOUNTAINS, Cover.

PREPARING CATTLE FOR EXHIBITION PURPOSES, 147.

CITRUS.—Bit of Citrus History; Irrigation of Orange Trees; An English Iceless Refrigerator Car; Fumigation in the Northern Counties, 148, 149.

DECIDUOUS.—Grafting the Peach; Methods of Inducing Fruit Bearing; Unseasonable Blooming of Trees; Squirrels and Gophers; How to Cut Scions; Picking Pears, 150, 151.

BEES.—Successful Management of Apiaries; Bees and Fruit Growing; Beeswax, 152.

LIVE STOCK AND DAIRY.—Hot Days, 153.

EDITORIAL.—University Farm School; National Irrigation Congress; A Busy Department; National Apple Show; Forest Fires; Year Book of 1907; Rumors of White Fly, 156.

AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, the Coast, 157.

POULTRY.—October Eggs; Apoplexy; Balanced Ration; Cheaper Feed; Mortality of Chicks; Do the Hens Pay; Setting the Hen; Good Layers, 158, 159, 160.

SMALL FRUITS AND VEGETABLES.—Potato Stalk Weevil; Beans and Vetches; Tomatoes, 161.

QUERIES AND REPLIES.—Apple Cider; Making Vinegar; Weevil; Red Spider; Drying Off the Cow; Abnormal Appetite; Bananas, 162.

VETERINARY.—Running Sore; Refuses Hay; Galled Shoulder; Bone Spavin, 162, 163.

ORNAMENTAL GARDEN.—Summer Care of the Lawn; Lippia Repens, 163.

HOUSEHOLD.—Undismayed; In the Last Act; Homely Hints; Washing Summer Dresses, 164, 165.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 166, 167.

UNIVERSITY FARM SCHOOL.

The short courses to be given at the University Farm this fall, are as follows:

Dairy Manufacture.—Eight weeks. October 5th—November 25th.

Irrigation, Soils, Forage Crops and Cereals.—Three weeks. October 12th—31st.

Poultry Husbandry.—Eight days. October 12th—20th.

Animal Industry and Veterinary Science.—Four weeks. October 21st—November 18th.

Horticulture and Viticulture.—Three Weeks. November 4th—25th.

The aim of the short course is to give the latest and best knowledge in a condensed and concentrated form to farmers and creamery operators who can spend only a brief period away from their business—to put into a nutshell, as it were, what is now known of the principles underlying the agricultural processes and their application to farm practice. The dominant feature of the course will be their emphasis of the practical aspect of the farm operations and the actual participation by the students in the work under consideration.

The farmers' courses are open to all persons who are at least seventeen years of age. No entrance examinations will be given nor any requirement imposed except an earnest desire to learn and to make the best use of the opportunities freely offered by the State through its university. Tuition is free, and the only charge is a small fee to cover cost of materials used by the student.

NATIONAL IRRIGATION CONGRESS.

The official call sent out by the Executive Committee of the Sixteenth National Irrigation Congress, announces Albuquerque the place and September 29 and 30 and October 1, 2 and 3 as the dates of the next meeting.

The same slogan giving the four objects of the congress is still retained: "Save the forests, store the floods, reclaim the deserts and make homes on the land."

All who are interested in the achievement of these objects or any of them are invited to attend the congress, and, by participating in its deliberations, contribute to a wise direction of national policies and development of practical methods of conserving and developing the great natural resources of the country, thereby insuring a greater stability of prosperous conditions, extending the habitable area, increasing the products of the land and developing internal trade and commerce.

National and State officials, irrigation and forestry experts, engineers, farmers and irrigators, manufacturers, professional and business men, industrial workers, editors and other representatives of the press will attend the Congress.

New Mexico promises a royal welcome and a care for the comfort of the guests. Full information may be had by addressing R. E. Twitshell, Secretary Board of Control, Albuquerque, N. M.

A BUSY DEPARTMENT.

In commenting on the work of the Department of Agriculture, the San Jose Times says:

"It will expend $15,000,000 during the fiscal year begining July 1. The amount is small in comparison with more than $200,000,000 for the Postoffice Department. But it is significant when placed beside a $4,000,000 outlay in 1902. If any administrative officer of the Government has reason for satisfaction with his work it is Secretary Wilson.

"Appropriations in large measure reflect popular demands. For instance, the amount set aside for the Forestry Service during the current year exceeds by $35,000 the entire allowance made to the department seven years ago. The Bureau of Animal Industry follows closely with $3,000,000 for its use.

"Perhaps no department in the Government organization covers so large a field, or benefits as many individuals, as the Agricultural Department. Its experiments in soils, its reports of the possibilities of newly-opened sections of country, and its circulated reports giving scientific reasons for the adoption of the methods it recommends in crop production, are invaluable to the producer, who in past years plodded on in ignorance of the opportunities of his vocation under intelligent direction."

NATIONAL APPLE SHOW.

The people of Spokane, Washington, are pushing the work of preparation for the apple show which is to be held in that city in December. Premiums to the extent of $25,000 are offered, one of which is $1000 for the finest single specimen.

The idea of holding an apple show originated with the members of the Washington State Horticultural Association. After a careful consideration, it was determined to make the affair one of a National character, and to bring together for comparison the standard varieties of winter apples from all sections of the world.

California should bring home some of those premiums.

FOREST FIRES.

California is having more than its share of destructive forest fires this season. Every year thousands of acres of magnificent trees are destroyed in this State by these fires started, no doubt, almost invariably by carelessness. But this year the disasters have been more wide spread than usual, owing doubtless to the fact that we were given practically no late spring rains. The greatest of these fires this year has been in Monterey and Santa Cruz counties. But this is only a drop as compared with the vast number which have raged in practically every county in the State.

As was said, these fires are invariably caused by carelessness, and the damage is such that no proper punishment can ever be meted to the person who has caused the fire. Every well wisher of the State should be alert to aid in every way forest rangers in detecting and bringing to punishment the careless camper or hunter who goes into the mountains and leaves conditions which may cause these fires.

It is not necessary that the careless camper should be the cause of a fire to be worthy of punishment; if he is so thoughtless as to leave a camp fire which might have caused a conflagration, that is sufficient in the eyes of the law to cause him to be arrested and fined. Of course, usually such a party is a reputable and good citizen who, through a momentary thoughtlessness, has done the act which entitles him to punishment. Until this punishment is meted out without mercy this law will continue to be violated. Let us all unite in making it more respected.

YEAR BOOK OF 1907.

Following the custom of the Department of Agriculture, James Wilson, the secretary, has issued and is distributing a year book for 1907. It is a book of 800 pages and full of matter interesting and instructive to the farmer. It is not materially different from the thirteen which have preceded it. But it seems to us it is rather fuller of practical information. Of course the first part of the book, 138 pages, is given up to the annual report of the secretary, in which he reviews the work of the past year and refers to the hopes for the coming year. The remainder of the book is made up of 27 different papers covering a wide variety of subjects, all prepared by officers and special investigators employed by the department. Added is also an appendix of nearly 300 pages with a vast number of tables of crop yields, information as to weather bureau, progress of forestry and a vast fund of other information. Of course the best part of all is a complete index covering the entire book.

This book is for distribution and Cultivator subscribers may secure it by writing to either of the United States Senators or the Member of Congress of the district in which the subscriber resides.

RUMORS OF WHITE FLY.

It is reported that the White fly has been found in trees at Visalia and Chico. What foundation there is for the report we are unable at present to say, but the story comes that a government entomologist found specimens at both places and that they were identified as Aleyrodes citri at Washington. Should this report prove true it would involve a vast destruction of property in those sections, for without doubt the same drastic measures would be necessary here that have been resorted to in Marysville and Oroville. It is to be feared that if this pest proves prevalent the State will suffer severely in the effort to exterminate it.

Shop Talk

SPECIAL CLUBBING OFFER.

The **Cultivator** has arranged for a special club rate with the **Sunset Magazine** of San Francisco, and we wish to announce this week a combination price for both.

This popular California monthly is just the thing to send to eastern friends and relatives and should be taken by all residents for the information derived regarding their own State.

It with the **Cultivator** is certainly a valuable combination: one for articles of general interest in the whole great West and the other thoroughly covering the agricultural interests of the same territory. The regular price of **Sunset** is $1.50 per year, but to **Cultivator** readers who order with our paper we are going to make a price of **$2.00 for both.** The offer is good with either new subscriptions or renewals, and we shall expect quick response to this announcement. Orders may be for both to one address or to different ones.

Agricultural Notes of the Pacific Coast

Northern California

Nevada county promises an immense Bartlett pear crop this season.

Extensive forest fires have raged near Enterprise, Butte county.

The big Hamilton Sugar Factory started up on the morning of August 3.

Several horses were destroyed by the terrific heat in the Sacramento Valley last week.

Yuba City cannery is packing between thirty and thirty-five thousand cans of peaches daily.

Yolo county soil survey undertaken by agents of the Department of Agriculture is in full swing.

Humboldt county supervisors have turned down a proposition looking toward a good roads campaign.

Winters Fruit Growers Association shipped its first car of Tokay grapes the first day of this month.

Small cucumbers for the Haywards Pickle Factory are being shipped from Gridley, Butte county, by express.

Sutter and Butte counties canal systems are reported to supply abundant water even in this dry year.

The fruit drying yards have accepted the hot weather with good grace as it was exactly to their liking.

Yolo county alfalfa hay is going to market in large quantity, Woodland selling her output for $11 per ton.

The grain crop of Yuba City is reported as exceptionally heavy though the straw will be a very light crop.

The Sacramento Valley Sugar Company is receiving quantities of beets from the fields about Davis in Yolo county.

Yuba City, Sutter county, is planning for the early establishment of a winery to handle the wine grapes of that county.

Irrigators and miners of Nevada county have had many a severe fight with forest fires in the endeavor to save irrigating flumes.

Forest Ranger Richardson of the Shasta National Forest will fence land within the forest reserve for the purpose of pasturing horses.

Forest fires at various points about the Sacramento Valley were held responsible by some for the recent intense heat prevailing all over the valley.

Many in Nevada county attribute the intensely hot weather of the last few days to the fact that there is practically no snow in the Sierra Mountains.

A filing was recently made on 5000 inches of water in the Consumnes River to the taken out near the meeting of the north and south forks of the river.

It is estimated that the output of hops in the Sacramento Valley and coast counties this year will be about 65,000 bales, which is about two-thirds the output for 1907.

Entire Sacramento Valley will join in an extensive exhibit to be made at three State fairs of the Middle West. They will be those of Iowa, Nebraska and Kansas. The exhibit will consist of fruits and other products of the valley and will be for advertising purposes. The work will be under direction of the Sacramento Valley Development Association.

Central California

Holdover raisins are now selling strong at 2¾ cents.

Monterey county will make a creditable exhibit at the coming State Fair.

Turlock, Stanislaus county, is shipping a couple of cars of cantaloupes daily.

Raisin men are beginning to feel hopeful as to the returns for the coming crop.

It has been rumored that some Fresno 1907 figs have been sold under the claim of being 1908 crop.

King City, Monterey county, has delivered some remarkably fine beets to the Spreckles factory at Salinas.

The Lodi Fruit & Produce Company is installing a quantity of machinery for the manufacture of grape juice.

Insect ravages in the beet fields near Castroville have been so severe that crops will be much under normal.

Santa Clara valley grape growers have organized and will affiliate with the State Grape Growers' Association.

Castroville, Monterey county, is building a new fruit packing house. It will be ready for the apple shipments of this fall.

Tulare County Board of Supervisors has granted a thousand dollars toward the expense of the Tulare County Agricultural Fair.

Kings County Board of Supervisors has refused to aid the coming county fair financially, and it is rumored that there will be no fair this year.

The directors of the Tulare Irrigation District held a meeting last week to discuss the question of increasing the water flow in the ditches.

Notwithstanding the large fruit crop of Central California, bankers have asserted that sufficient money is in sight to finance its handling.

Four thousand acres of fertile garden land near Antioch, Contra Costa county, were recently greatly damaged by the breaking of the levee.

Big sugar factory at Corcoran burned last week. The management expected to manufacture at least 100,000 sacks of sugar this season.

County Entomologist Morris of Santa Clara county reports satisfactory work with a four-winged fly which is doing good work on the codling moth.

The Department of Agriculture at Washington has assigned an additional expert to assist in devising a method of exterminating pear thrips.

The total shipment of citrus fruits from points north of Tehachapi, mostly in Tulare county, aggregated 3244 cars, with possibly a dozen more yet to go.

At a meeting of the San José Grange last week, the education of farmers for their life work, also the thrips pest, were principal subjects discussed.

The grape growers of the State organized for a campaign of education at San Francisco last week, electing Andrea Sbarboro president and H. F. Stoll secretary.

Tax payers under the Turlock Irrigation District will soon vote upon the question of raising $30,000 for expense and maintenance of the system for the coming year.

Southern California

The Alamitos sugar factory started July 28.

The Southern California tomato crop has been lighter this year than last.

Most of this season's output of grapes has been shipped from Imperial valley.

A Riverside fruit packer has secured a patent on a new orange packing box.

Highlands claims its orange crop to be about the same total as that of last year.

Orange county lima beans are looking exceptionally well and a good crop is assured.

The walnut crop in Southern California will be one of the largest in several years.

Various communities in Ventura are holding meetings to discuss the good roads problem.

Los Alamitos Sugar Factory will consume about 6000 tons of beets in its production this season.

Fully 3000 acres of celery are planted this season. This is not quite so great an acreage as last year.

A Riverside gardener has produced a fruit on a vine, which it is claimed closely resembles in flavor a peach.

Citrus growers of Southern California have held a conference with Senators Flint and Perkins on the subject of tariff on citrus fruits.

A Riverside orange grower has established a nursery at Phoenix for supplying Arizona citrus growers with "home made" citrus trees.

One nursery company at Beaumont has secured a contract to propagate and plant one million eucalyptus trees in Tulare county next spring.

Inspector Starr of the State Dairy Bureau has caused the arrest and fining of dairymen whose cows were too close to the pump at Ventura.

Notwithstanding a slight decrease in the hog market, the Los Angeles packers are planning to handle a greater number of hogs than any other season.

Riverside is contemplating an exhibit at the International Irrigation Congress to be held at Albuquerque. A large irrigation model will be one of the features.

Tomato growers who are planning for a fall crop are preparing for thorough spraying with Bordeaux mixture to save the crop from fungous diseases or blight.

Several sections of Southern California were visited by severe thunder showers last week. In some sections as much as half an inch was precipitated in a few hours.

Early sown grain in Imperial Valley is used to pasture stock after which it is allowed to grow and head out for grain. If planted as early as September it is said that this grain will give three separate pasturings.

The burning of a large packing house at Westminster, Orange county, last week, burned four carloads of onion sets ready for shipping to Texas. It is claimed that this was practically all the Bermuda onion sets in the United States and that it will materially affect the output of early onions next spring.

The Coast

The harvest at Colfax, Washington, is in full blast.

Threshing is in full swing at Garfield, Washington.

Hawaiian potatoes are freer from scab than most seasons.

Oregon State Fair will be held at Salem, Oregon, September 14-19.

Pacific National Show will be held at Portland, Oregon, September 21-26.

Hawaiian farmers use the soy bean in production of hay and green food for stock.

A severe hail storm recently visited Yakima valley, doing much damage to ripening fruit.

The Allen Cannery at Eugene, Oregon, has packed 9000 cases of Royal Anne cherries this season.

Hop growers of British Columbia are having a serious experience with a bettle which is very destructive.

A large woolen mill and warehouse at Marshallfield, Ore., was recently destroyed with a great loss of wool.

The Fruit & Vegetable Association of Eugene, Oregon, is doing excellent work in purchasing supplies for its members.

Palouse, Washington, wheat fields are threatened by the Jim Hill mustard, against which a strong fight is to be made.

The Western Washington Dairy and Fair Association will hold a fair at its new grounds in Seattle September 7-12.

Washington State Fair will be held at North Yakima September 28 to October 2. E. A. Graham of North Yakima, secretary.

Heavy showers recently falling in the neighborhood of Wilson Creek, Washington, have been worth thousands of dollars to ranchers.

The Grange Fair recently held near Pullman, Washington, was so successful that already plans are being laid for a bigger one next July.

The Whitman County Grange, Washington, has given a boost to the county fair, which will be held at Colfax September 28 to October 3.

Prof. E. F. Favor, formerly botanist in the Missouri Experiment Station, has taken a similar position in the Agricultural College of Utah.

Outlying sections around Honolulu have organized public improvement clubs, which are transforming ugly and unhealthful places into garden spots.

The Farmers' Educational and Cooperative Union at Pullman has a membership of more than 5000, all secured since the first organization, June 16.

More than $25,000 in cash premiums is offered for the first Annual Colorado Interstate Fair to be held at Denver September 7-12. G. C. Fuller, Denver, is the secretary.

Exhibits of cherries at the recent Salem fair were larger and showed finer fruit than the preceding fair. Yamhill county carried off the first prize for general exhibit.

A contest is on between white and Japanese labor at Pendleton, Ore., the Japanese contractor offering to supply all the labor necessary and the white laborers protesting that they are sufficient to harvest the crop.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

OCTOBER EGGS.

CHICKS hatched not later than the first of April should be laying by October first and possibly before if from some of the quick maturing breeds, but in order to do this they must have been hatched from eggs laid by strong, healthy birds, from a strain the tendency of which is to lay eggs. Again they must have been well hatched. If incubators have been neglected, temperatures have run up to 106 degrees several times or got down to 98 degrees during the night and the moisture and ventilation have been neglected, in consequence of which the chicks do not hatch until the 22nd or 23rd day, and show lack of vigor, we have not made a good start for October eggs. But properly hatching these October layers is child's play compared with successfully brooding and rearing. From the time they go into the brooders till the time they are fully matured the chick must never stop growing and developing. During the first week the brooder temperature should not be allowed to drop below 95 under the hover. Later, the temperature may be gradually decreased and at five or six weeks they can get along without artificial heat. If the chick is chilled during the early weeks of its career, the way is paved for a host of evil consequences, among them diarrhoea, roup, stunted growth, etc. Guard against crowding in the brooder. This is the error into which the amateur poultry raiser falls only too frequently. He puts a hundred little chicks into a brooder intended for 50. As a result 50 die during the first three weeks and the other 50 have received a check that handicaps them seriously as October layers. These birds that are to lay in October and continue doing so through the winter must be properly fed and have abundant exercise. Proper feeding implies sufficient food and not too much of a kind calculated to develop bone and muscle. All young animals require a ration containing a large per cent of muscle making food—a ration rich in protein. It must also be well supplied with mineral matter. Such a ration may be prepared by mixing cracked wheat, cracked corn and beef scrap, fine at first, later the coarser forms of beef scrap. Supply them with mineral matter in the form of fine bone and see that grit is accessible. For the first ten days a good chick food may be used if there are only a small number, but the cost where a large number are to be fed makes it advisable to cast about for something cheaper if equally efficient.

Get them to eating whole wheat as early as possible. There is much less danger from bowel troubles where dry foods are fed. In using cracked corn for small chicks the coarser particles must be screened out. Provide green food. See that shade is provided during the hot summer months. Guard against vermin, and October will find you with a bunch of pullets 75 per cent of which will give a good account of themselves. The other 25 per cent will probably never pay for their feed and should be sorted out and sold as soon as possible.

The young hens that are the early layers are apt to be the persistent layers. If a young hen is caught laying three successive days in September the chances are that she will be a heavy layer through the year. The active pullet with bright comb should be watched as a prospective layer. Because the mother of a bird has laid 250 eggs we are not warranted in assuming that the daughter is destined to do as well. The hen that laid the 250 eggs is a "sport" and the type is not well enough established to predict what her descendants will do. This truth is well established, so we must look to the individual rather than the ancestry of a fowl to determine what is to be expected from that individual as a layer.

POULTRY BREVITIES.

When anything goes wrong about the poultry yard find the cause.

* * *

Don't forget that growing chicks need animal food and mineral matter in the food.

* * *

Dairying and poultry farming make a good combination and furnishes a good market for the skim milk.

* * *

Care should be taken that hens are not allowed to become overfat, and at the same time they must be in good condition.

* * *

The two-year-old hen is to be preferred as a breeder to the pullet. Her eggs are more fertile and the chicks are stronger.

* * *

A tonic in the drinking water during the moulting period is advisable. Nothing is better than Douglass mixture for this purpose.

* * *

Many have the idea that pure bred fowls are not as hardy as mongrels, consequently require especial attention. This is not necessarily so.

* * *

"The breed that lays is the breed that pays," but it has been demonstrated that feeding has much to do with the number of eggs produced.

* * *

The grains and mill by-products are not sufficiently rich in protein to meet the demands of the growing or laying hen. Consequently, some concentrated food must be added to the ration. This is one of the reasons for the use of dried blood meat meal, oil cake, etc., in poultry rations.

* * *

Apoplexy.

Can the editor of the Poultry Department tell us what is the cause of the sudden deaths in our flock recently. We keep Barred Plymouth Rocks—some 75. They are liberally fed and lay well. In the last few months we have lost several suddenly. Some have been found under the roost in the morning; these birds were fat. One hen dropped dead as a result of being frightened by the dog. We have never had any disease in the flock and the houses are free from vermin. —E. J. C.

I think your hens have died from apoplexy. This is a trouble resulting from too liberal feeding. It is the fat, well nourished birds that die from it and have seldom known of a case in the Leghorn. The heavier breed are more susceptible. It cannot be cured, but can be prevented.

Feed less liberally, especially of fattening foods. Give the birds sufficient exercise, and if you care to resort to medical treatment, a dose of physic occasionally is indicated by the condition. Half a teaspoonful of castor oil is a sufficient dose for a hen.

* * *

Balanced Ration.

I am told that oil cake meal is a substance rich in egg making material, especially protein matter. Would it be a good substance to use with wheat, barley and Kaffir corn to make a balanced ration.—H. M. P.

While linseed oil meal is rich in protein the price at which it can be bought in California makes it an expensive source from which to get protein material to balance the starchy food found in the substances mentioned, i.e., Kaffir corn, wheat and barley. Retail dealers charge from $2.00 to $2.50 per hundred and there are about 26 pounds of protein in 100 pounds so the cost of protein is 8 to 10 cents. Beef scrap with 56 to 60 pounds of protein to the hundred costs $3.25 to $3.50 per hundred. In this case the protein costs about six cents per pound. Assuming that protein is what we are wanting, it is much cheaper in beef scrap. There is more starchy material in the linseed cake than in the blood.—S. S. T.

* * *

Cheaper Feed.

I have been a reader of your paper for some time, and read the poultry department with especial interest. I have about two hundred pullets, and about seventy-five laying hens. It is a problem with me as to what I should feed them. I have been feeding them on wheat and Coulson's egg food, but find that wheat at two cents a pound, and Coulson's at two dollars and a quarter per one hundred pounds is rather expensive. I have plenty of green feed and skimmed milk and my hens have laid well, but there is very little profit at the prices I have been paying for feed, and eggs selling for twenty cents per dozen. I saw in the Cultivator of July 9th an article advocating the feeding of barley when wheat was dear. I can buy barley for considerable less than wheat. Would it be well to feed it whole or would it be better cracked or rolled? If fed whole would it be better to soak it in water to soften the beards? Would barley and bran, dry in hoppers, and skimmed milk and green feed, make a good ration for chickens?—J. R. K., Gridley.

Wheat and barley have practically the same feeding value and where barley can be bought for less money it is economy to use it. Here is a difficulty; hens that have been used to eating wheat do not take kindly to barley at first. If they will eat it, I would not bother to use it rolled or soaked. If rolled barley is used the rolling costs $2.00 per ton and, in consequence, adds to the cost. I think if you make a dry mash of rolled barley and bran and feed the same in hoppers and then every night give a small feed of whole barley scattered on the ground you will soon have them readily eating the whole grain. With rolled barley and bran in hoppers a feed of whole barley scattered on the ground once a day plenty of skim milk and green food, you ought to be able to produce eggs at a minimum cost for food. Then if the expense for labor can be kept within reasonable bounds by using the hopper method of feeding and other labor saving devices, the cost of a dozen eggs ought to be kept well below the market price.

In your locality it ought to be possible to buy shrunken wheat at a figure well below the price of plump wheat. Shrunken wheat has a feeding value above that of plump wheat and should be used for the same reason that you contemplate using barley, viz., because we can get more food for a dollar out of it.—S. S. T.

MORTALITY OF CHICKS.

We are greatly impressed with the great mortality of baby chicks. Sometimes it amounts to fully one-half of the chicks hatched. This loss cuts out a big slice of the profits; often the season's work is a net loss. The problem of preventing this loss is worth consideration, for prevention is simpler and easier than cure.

Overcrowding, overfeeding and lice are the three chief causes of mortality in chicks. Overcrowding is easily prevented by being watchful and using common sense and so is overfeeding. The lice we should fight with eternal vigilance. It would seem a simpler matter to avoid crowding chicks in a brooder, but the majority of brooder manufacturers overrate the capacity of their brooders and people are deceived into putting a hundred or more in one brooder and do not realize that in two weeks the chicks have doubled in size. I would not put over sixty chicks in a brooder. Nature has her way of evening up things, and when a hundred chicks are crowded into space only sufficient for fifty, is pretty certain to thin them out by the usual methods of indigestion, of colds resulting from being overheated when crowded too much.

When chicks are overcrowded and do survive the perils of infancy, their constitutions are weakened. Some poultry raisers think that all of the loss is in the chickens that die. The lowering of the strength of those that succeed in living is a handicap upon them all through their life, and is visited upon the third and fourth generations.

Overcrowding is frequently due to imperfect heating of the brooder. This evil is not confined to brooders alone; it frequently occurs in the coops and often many dead ones are found. I never could understand why chicks would persist in piling up until dozens were smothered, but we have to be constantly on the lookout for these things that take away so many of our chicks. If everyone looked upon each dead chick as representing so much cash, I think that more poultry raisers would be more careful to reduce the loss, but too often when one hatching and rearing season is over these losses and trials are forgotten and the losses occur as before. A substantial aid would be to give the chicks reasonable room in the coops and to keep them clean. It is cruel to overfeed; the chicks soon get dumpish and then die; feed just a little at a time and often is a wise poultryman's rule; keep the chicks just a little hungry.

Disease and death result from filth and damp quarters. The droppings should be removed each day from the coops. Many diseases are likely to arise in damp weather that would not arise in dry weather.

Everything that I have written has been in reference to deaths and diseases which commonly occur before chicks reach the age of four weeks. After this age they seldom die of infantile woes. While other diseases often attack them, they belong to the contagious class.

Chicks hatched and brooded by hens may have any of the diseases referred to, but if the motherly instincts of the hen are of the best, her chicks are not likely to contract any disease for which best hen cannot, however, overcome disabilities inherited in the eggs she hatches.—St. Jo Fruit Grower.

The Only Prepared Roofing That Will Stand California Climate

The extreme heat at noon with the big drop in temperature at night, which soon puts an end to ordinary prepared roofings, cannot injure J-M ASBESTOS ROOFING, because it is made of asbestos—an indestructible mineral—on which even fire, acids, stable or chemical fumes have no effect.

J-M Asbestos Roofing

lasts indefinitely without repairs or painting in any climate. It keeps buildings cool. Is noiseless when rain falls on it, and does not taint rainwater. Yet it is cheaper than slate, tin or shingles in first cost, and cheaper than all other prepared roofings in the long run.

Comes all ready to lay. Nails and cement included. All you need is a hammer and knife.

Free to You Samples of our Asbestos Roofing and our Book No. 44 giving valuable information about roofing all kinds of buildings. Write for them today. A postal will do. Address,

H. W. Johns-Manville Co. 203 East Fifth Street Los Angeles, California

FEED YOUR PULLETS

As well as your Laying Hens, on

Coulson's Egg Food

It will bring them to maturity in health and vigor and ensure you lots of eggs in the Fall when prices are high. It can be fed moistened as a mash, or dry in hoppers. Manufactured only by

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one hest, not for sale.) We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear ahout our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow ahout. No Sunday sales or visitors. ***Wm. Starbuck & Son. Fullerton***

Trap-Nested White Wyandottes

That won 22 ribbons out of 25 and 6 Silver Cups and a carving set and a cut glass vase. All the National White Wyandotte Club Ribbons. Second on 10 pullet pen, contest open to all breeds. Mammoth Bronze Turkeys, winners of 5 blue ribbons, all at Los Angeles County Poultry Association Show, December 7, 1907. White Wyandottes were judged by H. Berrar of San Jose, Cal., and W. W. Browning of Ogden, Utah. Hens and Pullets, $15, $20 and up.

DO THE HENS PAY.

VERY few farmers or farmers' wives know whether the poultry pay or not. Eggs are eaten in the family; a few are sold from time to time. Occasionally a fowl is eaten, but if the owner is asked what the eggs produced cost per dozen or the meat per pound, he is at a loss to tell. The Poultry Advocate has the following advice on the subject that is worthy of careful consideration:

"It is always a satisfaction to know whether or not your poultry is on a paying basis. Many people find poultry raising a profitable and pleasureable occupation. Keep a record, an exact record of your receipts and expenditures connected with your poultry, and find out definitely whether they pay; not at certain times of the year, when it would be hard work to make poultry unprofitable, but all the year round. Keep continuous records. Charge up every cent of outlay on the fowls, and credit them with stock and eggs sold at the actual price received.

"And if it should be found at any time that, taken for the year, the proposition is a losing one, it is time for a thorough consideration of all the causes which contributed to that end. The records if carefully kept will show some facts which might not be so apparent otherwise.

"The beginner is advised to watch every detail of the business closely. It may be that the females are not from good egg laying strains and, therefore, the desired success may be impossible with them. It may be that the feed is too costly and not of the right kind to ensure either the proper development of the growing birds, or the greatest possible output of eggs. 'The breed that lays is the breed that pays' is a well-worn axiom in poultry culture. But it has been demonstrated, over and over again, that a strain of any breed may be developed in the egg laying habit to such an extent that were it alone of its breed considered, that breed might be well termed 'The breed that lays.' But in the creating of an egg laying strain, feeding has a great deal to do with the number of eggs produced. For instance, supposing you have purchased birds from a strain noted for its egg laying quality; if you were to starve your birds, or to feed them solely on corn, you would not get a good egg yield, no matter whether their ancestors for twenty generations before them had laid 200 eggs per hen per year. So we see that feeding has a vital influence in the production of eggs.

"If your fowls do not 'pay,' your records will be of great assistance to you in locating the cause, and then it is 'up to you' to reemdy it."

SETTING THE HEN.

Too much care cannot be exercised in the selection of the setter, nor in the manner in which she is set.

In the early spring months we are wont to set the first hen that clucks, regardless of whether she is suitable for the brooding business or not, and this is why we often waste a high priced setting of eggs and place all the blame on the hen. You should first be sure the hen is broody, allowing her to set for at least two or three days; she should then be examined as to lice, canker, roup, scaly legs and, in fact, any contagious disease.

Dust the hen thoroughly with a good louse powder and do not merely shake some of the preparation on her back and trust to luck that this will eliminate the lice. The feathers of the hen should be raised and the powder dusted down to the skin. Each section should be gone over until she is thoroughly dusted.

Scaly legs is a disease that the average poultryman pays no attention to, and there is not a disease among poultry that is so easily transmitted or will spread so thoroughly. If it is not dangerous it is unsightly and degenerates the flock. The setting hen is the fountain head for this disease, and double precaution should be taken, because of this. Under the new standard a specimen with a severe case of this ailment cannot be awarded a first prize, so this must be conclusive evidence as to the virulent nature of the malady.

You should have regular time to feed your hens and keep water before them all the time or it would be much better if you could place them where none of the other fowls could get to them, and keep feed where they would have access to it at all times.

A box of nice, dry earth or road dust will serve the purpose of a dust bath, which is essential. Did you ever notice that a setting hen will indulge in this practice even before she will satisfy her hunger?

We have the past few years made a practice of setting as many hens as possible at one time, and then giving a goodly number of chicks (from 15 to 20, this depends on the breed and the time of year) to a hen; this would create a surplus, and these we would set again, and we have found that their second "session" proved even better than the first. This may seem to some as cruel, but if the hen is given the right kind of care, she will be in better physical condition at the end of six weeks than three. If you do not make an attempt at sanitary conditions you had better never try working the hen "over time," as the vermin will get the better of you.

After the eggs begin to pip it would be well to darken the nest if possible, as biddy will attend to her duty much better.—Poultry Gazette.

GOOD LAYERS.

The Western Farmer has the following regarding the selection of layers:

One great secret of getting a good profit from poultry, as well as cows, is the weeding out of the unprofitable ones, writes one poultryman. A good many recommend the trap nest. Some claim that the trap nest to the average farmer is about as practicable as would be a line of trolley cars to carry him around his farm. In order to trap nest a flock of hens an attendant must be on hand to release the hen after she has laid, and give her credit on the books. A farmer cannot always do this. A set of trap nests is all right in its place, and that place is where hens are kept in sufficient numbers so an attendant is continually about the hen houses up to 3 or 4 o'clock in the afternoon. How then are we to judge which are the layers and which are the drones? My method is to judge by their looks and actions.

There is as much difference in the shape, disposition and appearance of individual hens as there is in individual cows or horses. The difference in characteristics can better be accurately judged in pure bred flocks than in flocks of mongrels, for with the former, when you have studied the breed you have adopted, as everyone should, until you have the shape imaged in your head and can recognize it anywhere, you have more uniform individuals to judge; while with mongrels and crosses, after the first cross especially, you never know what you are going to get either in shape, color, eyes, comb or general characteristic.

A hen that is soonest off the roost in the morning and the last to retire at night is what we call a hustler. She is looking for something to eat from which to produce an egg. A hen to produce eggs in large quantities must have good capacity to take food and good digestive organs to digest and assimilate the food eaten. You naturally, therefore, look for a long keel, apparently lengthened by a full breast filled out square with the keel by a good full crop. In such a hen the abdomen, while not bagging down much, will be well distended, showing egg capacity. You seldom see a hen, narrow between the legs and abdominal lines straight back from the legs, giving her a squeezed-in appearance from behind, that is a heavy producer. She is like a dairy cow built on beef lines. I prefer a hen with legs well apart, full breasted, with well developed abdomen. This indicates stamina and vigor. If she has a bright eye, red, healthy looking comb and head adjuncts, and has that alert carriage, coupled with the other characteristics mentioned, she is pretty surely a profitable hen, and watching will prove her the bird for the breeding pen to increase your egg production, and at the same time a carcass built on these lines is capable of supplying a trade for fancy table food.

We are so accustomed to thinking only of the heavy, very costly Billiard and Pool Tables that require a special room, and which only the very rich can afford, that it is a novelty and a pleasure to become acquainted with the Portable Tables sold by C. Ridderhof, Laughlin Building, Los Angeles.

They are built in all sizes, from a Miniature Pool Table three feet long up to Tourament Tables, and the line comprises Combination Library or Dining and Billiard Tables, as well as many styles for use on top of an ordinary table or on a folding stand.

All light enough to be easily portable, and for use in any room in the house or even on the porch; so reasonable in price as to be within the reach of all and yet rivaling regulation Tables in playing qualities.

Notwithstanding the fact that Billiards and Pool are sometimes played in undesirable places it is manifest to all right-thinking people that that which is undesirable has been in the environment, but not in the games, which are clean, instructive and entertaining in the highest degree.

Henry Ward Beecher said of the game: "I have a Billiard Table in my house, and every Christian family should have one. The game is a noble one; it should be encouraged in all safe ways. It must be regarded as one of the most charming games ever invented."

Other great men have expressed themselves similarly. In the country and in the smaller cities, where it is not so easy as in the large cities to find good entertainment, it is even more desirable to provide the best means of enjoyment at home, and the Portable Billiard Tables seem to solve the problem.

Small Fruits and Vegetables

THE POTATO-STALK WEEVIL.

THE potato-stalk weevil (Trichobaris trinotata) though unfamiliar to many potato growers, is by no means a new pest. Its presence in this State has been known since the year 1873. Though quite common, there is no record of any extensive or continuous injury sustained from its attacks till the year 1897, when there seems to have been a special onslaught by the insect. In June of that year there were many complaints of serious damage to the potato crops by this insect. During the spring of 1898 the insect was found in large numbers in Riley county. Investigations that were carried on during the same year reveal the fact that the insect is pretty well distributed over the Eastern and East Central parts of the State. It was found as far west as Dickinson and Saline counties.

The attacks of the weevil are not confined to the potato alone, as the insect is to be found in as large if not greater numbers in certain weeds which seem to be the original host-plants of the insect. The horse-nettle, Solanum Carolinense; cocklebur, Xanthium Canadense; stinkweed, Datura Stramonium; bull-nettle, Solinum rostratum; ground cherry, Physalis longifolia; are all subject to more or less attack by this insect. In several of the weeds, particularly in the ground cherry, the insect is more numerous than in the potato. As many as eight adults have been taken from the stalk of one ground cherry, while in the potato vines we have never found them so numerous, but only one specimen in the root and from one to five in the upper parts of the plant. Whenever the above-mentioned weeds are allowed to grow wild in any large numbers they are a constant menace to potato culture, in that they support the insect in large numbers to infest adjoining potato fields in the spring.

The adult is a small snout-beetle about one-fifth of an inch in length. It is an ashy gray color, and marked with three black spots at the base of the wing covers.

The weevil passes the winter in the adult stage, remaining till spring in the same plant in which it has passed through its transformations. About May the weevils emerge from their winter quarters and pass to the young growing potato plants, where they spend some time feeding. By June the female adult commences to deposit eggs. She first makes in the stalk a small slit about one-twelfth of an inch long, in which she deposits one egg. In the same way eggs are deposited in the main and secondary branches. In about a week the larva or grub hatches out and commences to work downward towards the root of the stalk. As it develops in size its channel becomes larger and more conspicuous. After channeling down a distance the larva turns around and commences to enlarge its old channel for at least a part of the way. It is this mining of the pith and the wood by the several larvae in the stalks and branches that impairs the vitality of the plant.

The larva when first hatched is a small, footless and whitish grub. At maturity it averages from six to eight-sixteenths of an inch in length, with a brown head and with dark-colored mouth parts. The body bears a few light colored hairs.

Just before pupating the larva constructs a cocoon of fibers in which it pupates. The pupal stage lasts from eight to 11 days. By July 22 a large number of the larvae have pupated and by August many are complete beetles.

Remedies.

As the adult passes the winter in the same plant in which it has gone through its transformation, the best remedy to use in combating the insect is to destroy the vines as soon as the crop is gathered. It is also a good plan to destroy in the fall all the above-mentioned weeds upon the farm. They should be pulled up with a good portion of their roots and destroyed. If pulling them should be too expensive an operation they should be cut down while young and allowed to dry up. By this means many of the immature larvae will be destroyed for want of proper food.

Promote a vigorous growth in the plants by clean cultivation and fertilizers. A healthy vine does not suffer so severely from the attacks of the pest. The greatest injury is seen in the vines of low vitality, which have suffered from the attacks of other insects, heat and drouth.—Bulletin 86, Kansas Station.

BEANS AND VETCHES.

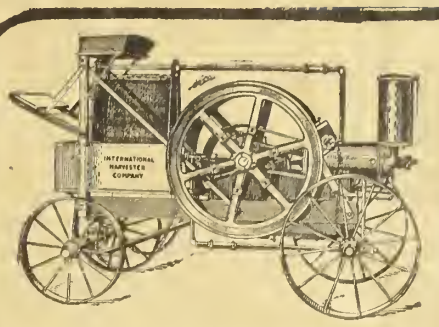
As known today these crops belong to several important genera of legumes, as Phaselous, Vicia, etc. In 1899 nearly 454,00 acres of beans were grown in the United States, producing a crop worth $7,634,262. This income was derived through the cultivation of varieties belonging to but few species of the named genera. However, the vast majority of the beans of the world are wholly unknown to agriculture. The genus Phaseolus contains 164 described species of widely different characteristics, while the genus Vicia contains over 230 known forms, making a total for these two genera of beans and vetches of 400 or more species.

When we consider the great value of these plants not alone as food for man and feed for stock, but their great worth as soil enrichers, the wisdom of bringing together these hundreds of species for study and improvement will be self evident. This work has never been attempted in a comprehensive manner, but if carried out by the United States it would add tens of millions of dollars annually to our wealth.

TOMATOES.

Tomatoes will be at their best in August, and then is the time to lay in a supply for canning and preserving purposes. Such is the adaptability of this vegetable that it can be used as a fruit or vegetable at will. As a healthy vegetable, cooked or raw, it is unsurpassed, and in midsummer, when most of what are summer vegetables in more northern latitudes are more or less out of season, the tomato admirably fills up the gap. For canning to get the full flavor, they should be put up during this month, as the warm summer sunshine gives them their best flavor. As cooler weather comes on they are less highly flavored, but still far ahead of the canned article.

A study of the aphis which has been so disastrous to bean and melon fields this year has been quite extensive and it hoped that this pest may be controlled.



I·H·C GASOLINE ENGINES

Are solving the hired help problem for hundreds of farmers.

Vertical Engines made in 2 and 3-Horse Power.
Horizontal Engines (Portable and Stationary) made in 4, 6, 8, 10, 12, 15 and 20-Horse Power.
Air Cooled Engines, 1-Horse Power.
Traction Engines, 10, 12, 15 and 20-Horse Power.
Also sawing, spraying and pumping outfits.

YOU offer high wages, and still find it difficult to get hired men. Why not do as other progressive farmers are doing—let one of the dependable and ever ready I. H. C. gasoline engines be your hired man?

Suppose you want to grind feed, pump water, operate the churn, grindstone, fanning mill, separator, bone cutter, or saw wood. With an I. H. C. engine you will need no extra help. You can run the engine and attend to the machine yourself.

In the same way it can be used too for irrigating—pumping from wells, lakes, ponds and running streams. The operator can handle the head of water in the field and also attend to the engine.

The engine will work for you indoors or out, in wet or dry, hot or cold weather. You will have no difficulty in operating or controlling it.

Only a few cents per hour is required for fuel. All I. H. C. engines use either gas, gasoline or denatured alcohol.

Please notice in the above list of styles and sizes that there is an I. H. C. gasoline engine adapted to practically every farm requirement.

You can have a small engine which you can easily move from place to place, as your work requires, or you can have a larger engine for stationary use. The efficiency of all I. H. C. engines is well known. You cannot possibly have any better guarantee of a dependable engine than one of these engines affords.

Call on the International local agent for catalogs, and inspect these engines. Write nearest branch house for colored hanger and booklet on "Development of Power."

Peckham Says

Increase Your Income $2,000 a Year

I want every man or woman who is interested in his or her future to look into our Corcoran land proposition, the land that you easily make $2000 a year on.

I want you to see this land for yourself, you can go with the next party I take to look at the property, or I will gladly furnish you with names of men who have gone, and you can ask them what conditions they found.

There are many features of this land that make it safe and profitable which I haven't space to touch upon, but any one living in Los Angeles who is interested should call at my office for details; those living outside of the city should send for Profitable Realty, which gives full details.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Apple Cider.

Is there any method of preparing apple cider so it will keep and not turn to vinegar?—E. B. W.

To preserve fruit juices and retain their flavor so they will not have the "boiled" taste, they are usually placed in bottles, which in turn are placed in a boiler or some large vessel, care being taken to have wooden strips underneath the bottles. The water bath is then placed over the fire and heated until the juices are about 160 to 170 degrees. These bottles are then kept in a cool dark place and allowed to settle for a few days. Then filter and again heat in the water bath, and while they are hot insert stoppers which have been soaked in boiling paraffine. If care has been exercised to thoroughly sterilize the bottles and the stoppers and everything connected, fruit juice put up in this way will keep for years.

Making Vinegar.

Can I use peelings and small fruits such as pears and cling peaches with pits and all and make vinegar? How long would the vinegar have to stand before it could be used?—A. R., Geyserville.

Vinegar is often made in the manner of which you speak, the small fruit being crushed so as to liberate the juice as much as possible. Place in barrel with open head and cover with cloth. A little yeast may be added as a starter and after two or three weeks the juice may be racked or filtered off from the pummace. When it can be secured, "mother" may be added from the old vinegar barrel. Standing a few weeks after this with the bung of the barrel open usually succeeds in making a good quality of vinegar. As to market quotations on such a grade of vinegar we are not informed. The yeast is not essential, but hastens the work.

Weevil.

Please give remedy for the bug which destroys seed beans.—Subscriber, Santa Ana.

Usual remedy for the weevil, which we presume this is, is carbon bisulphide. The beans are placed in a strictly air tight box, or bin or room, and the bisulphide placed in such a way that the fumes as it evaporates will thoroughly penetrate the entire mass. This insures death to the weevil which may be in the beans, but is not preventive, as they may be infested again if they are not placed in a room which is free from weevil.

Red Spider.

I have sprayed with Bordeaux mixture with Paris green added, but it does not seem to kill the spiders.—C. W. J., Laton.

Your spraying with Bordeaux mixture and Paris green was of no value whatever for the red spider. The usual treatment is simply dry sulphur, applied by use of bellows, or even by scattering by hand over the trees or vines; but to be of much value this treatment must be applied before there is any material manifestation of the insect. For after its work is apparent it is probable the insect has finished its life work and disappeared, leaving only the result of its depredations.

Drying Off the Cow.

The article in Cultivator of July 16 in regard to continuous milking was very interesting to me. I have two Jersey cows, one two years old last September, was fresh in October; one six years old, fresh in September. They will each be fresh again in the same months. Each gave 22 lbs. a day when fresh. Now the heifer gives 17 lbs. and the cow 19 lbs. I feed alfalfa hay, sweet cornstalks and a little green alfalfa, 4 lbs. shorts, 3 lbs. bran and 1 tablespoon of West Coast stock food. Now I know by experience that the only way to dry this cow off is to stop all this feed and feed straw. Then it is a hard job. I supposed she should have a few weeks' rest. If I continue to milk these cows should I continue the same amount of feed? And when should they be bred again? Am interested reader of Cultivator.—C. J. S., Rialto.

Neither of these cows is a heavy milker. They should not be hard to dry off if you watch for the natural pause in the milk flow that comes eight or ten weeks before calving. When it is found there is a slight decrease in the milk at this time, follow it up by leaving a little milk in the udder at each milking, and as it decreases further milk once a day, then every other day. At the same time the succulency of the ration may be decreased by changing green corn and alfalfa for alfalfa hay and gradually decreasing the grain ration. If, however, it is thought desirable to continue milking these cows, feed until ten days before calving, then drop out the grain, except a quart of bran for laxative effect, and give alfalfa hay. After the cow has been fresh six days, begin to gradually bring her up on her feed by adding each day a little extra until she is again on full rations.

Abnormal Appetite.

What causes my cows to eat fence boards, old rags, bones, etc., when they are on good pasture and have salt and ashes before them?—Subscriber, Arcata.

Want of rough food and lime is usually given as the cause of cows having depraved appetites. Add a little straw or rough hay, as barley hay, to the rations, and bone meal will stop them eating trash. We buy fresh butcher bones and run them through a poultry bone cutter. Give half a tablespoonful to each cow in her feed. Rags and bones, outside of the fact that they are not clean foods, may become dangerous to the cows by choking them.

Bananas.

Why does the fruit on banana trees only set one or two rows of bananas and the rest of the blossoms drop off? Has the watering anything to do with it?—P. J. G., San Diego.

The watering may possibly affect the setting of fruit on bananas, but think the climate is the principal cause of the trouble common all over California. The banana is a purely tropical plant. It will exist in California and is a beautiful ornament in the yard, but the arid condition is not to its liking, so will not bear to any extent. If you will remove your plant to some moist, humid section of Central America, where the big lusty mosquitos will bore you full of malaria and yellow fever germs, where it is as hot at midnight as it is at noonday, you will get much better results with the banana. Personally, we prefer to pay two bits a dozen for ours.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Veterinary

Dr. R. T. Whittiesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittiesey direct should contain a great big dollar.

Running Sore.

Yesterday my cow did not seem at all well in the forenoon, but in the afternoon she became apparently all right. Last night we discovered a swelling near the milk gland in front of the bag; now it is a huge running sore. She has a good appetite and seems to feel well this morning. Several times she has seemed bloated, although she had no food liable to bloat her. Please tell me what treatment to follow, probable cause, and how soon the milk will be fit for use. We noticed for about two weeks that the milk not only soured quickly but became musty in odor, although we have a good place to keep it. Was that due to her condition? Her food is dry alfalfa, with bran twice a day. She has good water and a clean, cool stable and corral.—Mrs. L.

Wash the sore thoroughly with hose twice daily and follow with dry zinc oxide powder. If she bloats on alfalfa hay change to dry oat hay; give plenty of salt and drench with one-half ounce of eucamphol in one quart of water twice daily.

Milk is good at any time if there is no fever; this you will have to learn from the use of a clinical thermometer.

Refuses Hay.

My mare slobbers and will not eat hay of any kind. I took her twice to the veterinary and he cleaned her mouth and said her mouth was tender, but it did no good. She does not work; in fact, is not used at all. I feed her rolled barley and bran, and have plenty of hay always in the rack, but she grows thinner all the time.—S. D., San Martin.

Horses very frequently slobber from the irritation of the bit or from the salivary glands being in a diseased condition. Your mare may get low in flesh even when her teeth are all right. Worms, a diseased liver or a dyspeptic condition of the stomach and intestines. This would take a thorough examination by a veterinarian, and might take a day or two to make a thorough examination. You are not very far from San Jose and Drs. Spencer and Healy of that city will probably be able to help you out.

Galled Shoulders.

Will you kindly inform me through the columns of the California Cultivator of a good preparation that may be made at home for sore shoulders on horses and mules. We have to pay such a high price here for gall cure that we are obliged to resort to something that will be less expensive. We work about thirty head constantly; wash their shoulders every night, and use pads on the collars and try to make the collars fit as near right as possible, yet we have considerable trouble from their sore shoulders.

A preparation of one tablespoonful of turpentine to a cup of unsalted hog grease mixed with enough sulphur to form a paste, was recommended by a neighbor and tried. It was not satisfactory because the sulphur formed a hard, dry crust over the sore and when the horse was worked the next

day only served as an irritant. The rubbing of the collar had the same effect on the turpentine. If you can tell me of some preparation that will be softening and healing, something that can be put on in the night and when they are going to work, also, I will be very much indebted to you.—F. N., Holtville.

Use no salve or ointments on sore shoulders that are to wear collars, as it will gather dirt and make good shoulders sore.

Why any one will use turpentine on sores on a horse is beyond my comprehension, as there are few things that will blister more severely. Wash the shoulders thoroughly with the following:

Formaline one and one-half ounce to one gallon of water; no stronger.

See that the pads are dry and clean. In the morning dust the sore shoulders and pad where it touches the sore with dry graphite.

Bone Spavin.

Be so kind as to inform me as to the treatment for bone spavin on horse and oblige.—A Subscriber, Hemet.

Thorough firing with pointed "thermocautery" is about the only successful treatment; this in most cases will effect a cure.

CULTIVATOR and SUNSET together for one year, $2.00. Order through Cultivator. See notice under "Shop Talk."

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers, and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

SUMMER CARE OF THE LAWN.

THE suroundings of the home generally indicate the artistic ability, or lack of it, of the dweller. The picture of the home is spread upon the canvas of the lawn, and we unconsciously size up the dweller by his success in presenting this picture to us. In this endeavor the care of the lawn plays an important part.

Leaving, at present, the question of planting the lawn for consideration at another time, the following hints regarding care of lawns may be helpful:

Lawns are best watered with the hose if water supply of that character is available. One of the many styles of sprinklers attached to the end of the hose is desirable as a time saver. If there is no hydrant, the lawn should be flooded every ten days or two weeks. The water in this case should not be allowed to stay on for a great while, especially if there is much shade, or the grass roots will be destroyed wholly or in part and yellow spots will appear here and there in the sward. Of whatever character it is, thorough watering best follows immediately after mowing.

Ordinarily the lawn should be gone over every week or ten days with the lawn mower, the snorter period being better where the water supply is constant. The appearance of the sward is greatly improved by observing the following points: First, the use of the "grass-catcher" attachment to the machine for the removal of the cut grass; second, mowing in straight lines, and so far as possible in the same direction; third, lapping the machine only one-half the width of the swath; fourth, trimming out with sickle and sheep-shears all the grass which cannot be reached with the mower.

The following comments may be made upon the preceding statements. In the use of the apron or "catcher," it should be remembered that the removal of the grass at every mowing means the removal of fertility which should be restored by manuring, but the velvety appearance which we so much admire is secured better than by letting the grass lie where it falls. From a new lawn, however, i.e., one planted in the current season, the grass should not be removed, but allowed to lie where it falls for its value as a mulch. The direction of the mowing should be alternated in successive mowing, preferably at right angles to the previous mowing. Trees, buildings, etc., are left by the machine with an unsightly fringe of tall grass, which a little extra care with sickle and scissors will vastly improve. The sward about a bed or border should end in an abrupt edge and this edge trimmed with the shears. Pushing the soil back towards the middle of the bed gives the edge its desirable abruptness. Walks should be similarly edged.

While mowing high and low places and holes should be noted for subsequent correction. The man with the mower learns one reason why terraces and abrupt banks are undesirable. When these are run over by the mower the knives bite so deeply that these high points become "sore spots," due to the killing out of the too closely shorn grass. Holes may be filled with prepared soil (garden loam and sand in equal parts) and the grass will shortly come up through it. Such corrections involve the lifting of the sod and the addition or removal of soil. Occasionally high places may be corrected by the use of a heavy roller.

Attention to such minute details as above described insures that well-groomed appearance in lawns which everyone admires.—Leslie F. Paul, Colorado Agricultural College.

LIPPIA REPENS.

Lippia Repens is a creeping lawn plant, slightly resembling clover in appearance, remarkable for its power of flourishing with little water, through the long, dry California summer. It covers the ground with a thick smooth mat of green quite as handsome as ordinary lawn grass, while, unlike grass, it requires very little water, weeding or mowing.

Lippia comes from the dry regions of Northern Africa, and is extensively used in Southern Europe for lawns, garden walks and tennis courts. Recently introduced into Southern California, its use has become general there as a substitute for lawn grass. Summer resorts throughout that section have made extensive use of Lippia in their grounds.

Clinging closely to the ground, Lippia roots at every joint and spreads out rapidly from the center plant. The roots penetrate deep into the ground, drawing up moisture from a great depth. Lippia requires water only during the dryest summer months, and then only at intervals of two weeks or more. It will even go through the summer with no water without material damage, though without any water it suffers somewhat in appearance.

Never rising from the ground more than three inches, Lippia requires little mowing, and may be left entirely without it, though an occasional application of the lawn mower improves its appearance and stimulates its growth. The little pink flowers which rise from it in great profusion in midsummer should be mowed off as soon as they begin to fade.

In winter weeds occasionally come up through the Lippia turf, as it is then partially dormant, but as soon as hot weather comes on the weeds, being less hardy, are choked out and disappear. Even morning glory will be choked out by Lippia in this manner. Notwithstanding its great hardiness, Lippia cannot become a pest, as it does not seed, and when cut off below ground cannot sprout up from the roots.

As Lippia does not grow from seed, it is propagated by planting little squares of the turf, with roots and soil adhering. These little squares, an inch or so across, are planted a foot apart each way, and in a few months' time spread over the entire surface of the ground. The lawn thus established is permanent in character and does not have to be replanted.

To start a Lippia lawn cultivate the ground thoroughly, leaving a surface flat, smooth and free from clods. Cut the turf for planting into squares an inch and a half across. Plant these a foot apart and keep ground between moist and soft. It is surprising how soon the little runners will fill all the space and a soil mat of green begin.

It will stand tramping and wear, but, of course, in such a situation does not make the luxuriant growth which it does if left unmolested.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Several hundred iron fence posts. H. KELLY MACHINERY CO., corner of Mission road and Macy street, Los Angeles, Cal.

FOR SALE—SECONDHAND PIPE AND oil well casing, all sizes, any amount; boilers and engines; gas and distillate engines; pumps, etc. Get our prices before you buy. A. CANNADY & CO., 1629 N. Alameda St., Los Angeles, Cal.

MACHINERY OF ALL KINDS BOUGHT, sold and exchanged; complete pumping plants installed. See us before buying. Can save you money. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles.

FOR SALE—JUST OVERHAULED IN LOcal machine shop. 25-H. P. White and Middleton gasoline engine guaranteed like new. Will sell cheap. 117 BRUNO ST., Los Angeles.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FOR SALE—50-H. P. FAIRBANKS-MORSE distillate engine guaranteed the equal of new at an exceptionally low price. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles.

FOR SALE—SMALL GASOLINE ENGINE and centrifugal pump never been used. A rare bargain. N. W. cor. MAIN and BRUNO STS., Los Angeles.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

EGGS FOR HATCHING.

EGGS FROM MY PRIZE WINNING BARred Rocks; won all firsts, all seconds but one, and all specials on Barred Rocks at L. A. C. P. A. Show, 1907. Eggs from best pens, $3 per 15; $12.50 per 100. Stock for sale. CHAS. E. SMITH, Gardena, Cal. San Pedro Interurban car to Smith's Crossing.

POULTRY

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. Regular 10c can free, postage paid, for 10 addresses of poultry keepers. WEST COAST MILL, 705 Griffin Ave., Los Angeles Cal.

BUFF ORPINGTONS—WOULD YOU LIKE the very best at the price of common stock? Sullivan's COMMONWEALTH STRAIN you may have at HALF PRICE FOR THE BALANCE OF THE SEASON. Write us and learn the reason; get record and illustrated catalogue FREE.—MR. & MRS. W. S. SULLIVAN, Agnew, Santa Clara Co., Cal.

FOR SALE—STOCK AND EGGS OF THE following standard bred poultry: Black and White Orpingtons, Brown and White Leghorns. J. J. Verkouteren, Route 3, Hanford, California.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

CATTLE.

FOR SALE—FINE THOROUGHBRED JERsey bull, a direct descendant of Bessie. Call or write, M. GRONER, 320 Railroad St., South Pasadena, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

FOR SALE—COCKER SPANIEL PUPS, 8 weeks old; blacks, $10 each. MINNEWAWA VINEYARD, Fresno, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

SEED.

FOR SALE—EUCALYPTUS RUDIS SEED, fresh, by pound or ounce. MINNEWAWA VINEYARD, Fresno, Cal.

PARTNER WANTED.

WANTED—A PARTY TO TAKE AN INterest in my seed and poultry supply business, who has a good nursery and can furnish plenty of nursery stock. Have a fine store; grand location and splendid opportunity. Address or call, S. H. CHURCH, 636 S. Main St., Los Angeles.

NURSERY FOR SALE.

OLD ESTABLISHED NURSERY BUSINESS for sale. Good stock. Good location. Good reasons for selling. Address THE AUBURN NURSERIES, East Auburn, Cal.

RANCHES WANTED.

WANTED—A SMALL IMPROVED IRRIGAble alfalfa farm. Trees, good water.—G. BOZARTH, Northern Road, San Jose, Cal.

HARD OF HEARING.

A gentleman undertook to purchase a waist for his wife.

"What bust?" inquired the saleswoman.

"Why, I didn't hear anything."

Household Department

UNDISMAYED.

He came up smilin'—used to say
He made his fortune that-a-way;
He had hard luck a-plenty, too,
But settled down an' fought her through;
An' every time he's got a jolt
He jist took on a tighter holt,
Slipped back some when he tried to climb,
But came up smilin' every time.

He came up smilin'—used to git
His shar o' knocks, but he had grit,
An' if they hurt he didn't set
Around th groc'ry store an' fret,
He jist grabbed Fortune by th' hair
An' hung on till he got his share,
He had th' grit in him to stay
An' come up smilin' every day.

He jist gripped hard an' all alone
Like a set bull-pup with a bone.
An' if he got shook loose, why then
He got up an' grabbed holt again;
He didn't have no time, he'd say.
To bother about yesterday,
An' when there was a prize to win
He came up smilin' an' pitched in.
He came up smilin'—good fer him!
He had th' grit, pluck an' vim.
So he's on Easy street, an' durned
If I don't think his luck is earned!
No matter if he lost sometimes,
He's got th' stuff in him that climbs,
An' when his chance was mighty slim,
He came up smilin'—good fer him!

—New York Times.

IN THE LAST ACT.

"YOU'RE cross and hateful, and I never want to see you again," declared Molly, as she flung herself away.

"I'm not cross and hateful," declared Beverly Gideon. "If you insist upon going on the stage you are at liberty to do so. But you cannot blame me for wanting my wife to be something more to me than a name on the billboards and in the dramatic papers."

"You want a household drudge," she proclaimed. "That is all you want. I want to let the fires of my genius burn brightly, not smolder, a sacrifice on the household altar."

Gideon shrugged his shoulders.

"I suppose you will not mind playing tonight," he said. "It's part of the dramatic drudgery to make love to some one you hate, you know. It will be good practice."

"I shall not let your hatefulness spoil my chances," she said. "You know what it means to me tonight. I think you are trying to make me break down on purpose."

"Not at all," he said. "If you will trace this conversation back, you will find that it was yourself who started it."

"Then I shall be the first to stop," she declared, as she turned and left him.

Molly Waterbury was at once most delightful and most irritating.

She had been the leading woman of the Carston Dramatic Club ever since she was old enough to wear long dresses. Gideon, who liked acting as an amusement, had played opposite to her for so long that it had seemed only natural that he should play the part of lover when there was no rehearsal, and so they had become engaged.

He had always regarded her chatter of the time when they should go upon the stage together as the dreams of an ambitious girl, but this morning she had told him that Denslow, the manager, had promised to attend the performance and if he found her capable he would give her a chance in one of his companies.

Instead of rejoicing over her good fortune Gideon had objected to having her adopt a stage career, and words had followed that had resulted in the return of the engagement ring.

The little stage of the Carston Lyceum buzzed like a beehive that night. Distressed young women ran about declaring that they never could act with the great Denslow sitting out in front.

The stage manager hurriedly sent out to borrow ornaments for the stage, determined that the celebrated producer should compliment his setting.

Gideon sat gloomily in one corner, while through all the din passed Molly, calming the hysterical girls, conferring with the stage manager and utterly oblivious of Gideon's presence.

Every little while she ran to the peep hole in the curtain, and when at last Denslow entered with her parents the entire company lined up to get a glimpse of the celebrated man.

In the first two acts Molly played the part of the capricious young girl so fearful of being wooed for her money that she scorned all suitors. Gideon gave her perfect support, suppressing himself in his endeavor to give her the attention of the audience, yet always giving the assistance she needed.

In the third act, tired of her caprice, he is about to leave the country, and she, for the first time, realizes that she really loves him and pleads with him to stay, while he, thinking that she is merely seeking to torment him, fights off his yearning to take her in his arms.

If Molly's work in the earlier acts had been capital, now she surpassed herself. Somehow the lines seemed to fit into the real situation. The feeling that Gideon's lovemaking in the earlier scenes had been perfunctory made her aware of what she had given up, and she threw into her lines a passion and feeling that caused Denslow to turn to her father and say: "I'll make a star of her."

At last, with a final sweep of passion, she worked up to the climax and the curtain fell as she threw herself into Gideon's arms.

Twice the curtain rose, but instead of the bowing stars it showed only a continuation of the picture with Gideon still holding her in his arms and whispering to her.

Then the light went out and Denslow came hurrying back on the stage.

"My dear Miss Waterbury," he cried, "I am delighted with your performance. We shall have you a star in a few years."

"I don't think I want to go on the stage," she said.

"But to hide such talent under a bushel. It is an artistic crime. I never saw better acting than in that last scene."

"That's just it," said Molly frankly. "You see, it wasn't acting at all."

Denslow caught the glint of Gideons' eyes. "I see," he agreed, though he comprehended only dimly. "Let me congratulate Mr. Gideon upon his acting and his success."

PA WOULD DO IT.

"Hang it," growled young Lovett to the girl of his heart, "it makes me mad every time I think of that $10 I lost today. I certainly feel as if I'd like to have somebody kick me."

"By the way, Jack," said the dear girl, dreamily, "don't you think you'd better speak to father this evening?"

—Philadelphia Press.

HOMELY HINTS.

A scorch mark on linen, if not too brown, may be removed by moistening with water and laying in the sun. Repeat the moistening two or three times, and the mark will disappear.

Before using a new broom, steep it in hot water for a few moments, and it will last much longer.

For Washing Heavy Overalls.

For the benefit of women who have men's heavy overalls and shirts to wash: Instead of rubbing on the washboard, the usual way, spread them on the board and brush with a scrubbrush and plenty of soap. It will save the wear of both hands and garment.

A box of thin wood is handier than a bag to hold strings because a glance into the open box enables one to select a string of the right strength and proper color. If each string taken from a bundle is wound over the fingers and the end is wound a few times around the coil the different strings in the box will not become entangled. This method is better than winding different strings into one ball.

New bread is generally very hard to cut neatly. If you will dip the knife into hot water first, you will be surprised how easily and neatly the bread will cut.

To clean draperies, use sawdust and ammonia. Put the sawdust into a tub and pour in enough household ammonia to soak it to the bottom. Beat the draperies or rugs free of dust. Put them into the sawdust and, with a small whisk broom, rub the mixture well into the article to be cleaned. The dirt will disappear at once. Hang out of doors to dry and air.

The Useful Oyster Shell.

A common oyster shell is a durable pot and pan cleaner. Drill a hole in the center of one and put a lid knob in it. One may buy one knob at a hardware store for 3 cents, or two for 5 cents.

Care of Shoes.

If a pair of shoes have become stiffened with walking in the wet they should first be washed with warm water and then have oil well rubbed into them.

Cleaning Brushes.

Valuable brushes, such as those with ivory or tortoise-shell backs, may be thoroughly cleaned by using bran instead of soap and water. The brush is dipped into bran, which must be rubbed into the bristles as one would do soap, and the particles may afterward be removed by tapping the brush, bristles downward, on the table. The process is somewhat lengthy, but it prevents the bristles from becoming softened, as they inevitably must be if wetted. When every trace of bran has been removed, the brush will be found to be perfectly clean and may then be wiped with a soft silk handkerchief.

About Floors.

Many old floors are being stained about the sides of the room, so as to admit of a rug in the center. One difficulty in this work is the wide cracks often yawning between the boards. But heated paraffin can be poured from a narrow spout into these cracks, filling them rapidly and easily.

DOUBLE VALUE.

Courtesy has a cash as well as an ethical value.

The Personal Neatness Club

WASHING SUMMER DRESSES.

In making up a summer dress one should choose a style that lends itself readily to washing and ironing. There are now, fortunately, always sufficiently varied up-to-date fashions to admit of a wide range in selection, unlike the days when our grandmothers were young and there was but one fashionable style and one fashionable color which every one wore, irrespective of its adaptability to their individual style. The trimming of a washing dress should, obviously, consist rather in rows of lace inserting, tucks or fancy braids than in a multiplicity of frills or plaitings, both of the latter, especially when small, being difficult to launder nicely. One deep flounce on the skirt, either shaped, straight or scalloped, seems to be a model well adapted for washing skirts, very much more so than several narrow flounces. Gathers, in the back of the skirt and elsewhere, are always preferable to folds and plaits in anything to be washed.

The more expensive weaves of gingham and other wash fabrics would seem to have a greater tendency to shrink in washing than the cheaper ten-cent pieces; oddly enough, five-cent calico seems to wash better and more easily than anything, even the dyes very seldom fading when left to the family wash without special injunctions, unless they be of a color exceptionally liable to fade, such as green or pale blue. In making up the skirt of a twenty-five or forty-cent gingham, one should calculate on a shrinkage of quite an inch and a half, for which reason it is advisable to allow a generous hem round the bottom, and, if possible, blind-stitch it by hand so as to rip the more easily for subsequent lengthening to remedy the shrinkage. It is better to rip the bottom hem before sending to the wash, since if one postpones it until afterward the original crease may be visible until it is washed a second time. For this reason the sleeves should also be made long. Some old-fashioned people will to this day counsel shrinking every wash material before making it up, but few of us could reconcile ourselves to treating pretty new goods in that way, even if we might subsequently regret not having done so. Many weaves of cotton, moreover, do not shrink appreciably in the washing.

In making selections, it is well to remember that, other things being equal, white washes best, being free from the danger of fading and requiring no special attention beyond the rest of the weekly wash. Pinks and reds are also, as a rule, easily washed, needing very little special care. Delicate greens and pale blues are, perhaps, the most apt to fade. It is a good plan to take a small sample of any chosen piece of goods and see how it stands washing before buying the dress length. Wash silks, as a rule, are surprisingly serviceable and satisfactory; indeed, there seems no end to the wear of some of them, and they wash more easily than anything; though much less expensive than taffeta, they wear three times as long. They should, of course, never be boiled, but treated much as muslins or fine prints.

Tinted or patterned wash goods, such as muslins, dimities, French calicoes, ginghams, etc., should, of course, never be boiled or even put in boiling water, as heat has always a fading tendency. If very much soiled, they may need a little borax. Reds, pinks and yellows do not fade so easily as greens and light blues, for which reason patterns containing the two latter colors require especial care. They should not be rubbed in washing—nor indeed should any muslin or patterned goods, as it spoils the surface; simply squeezing with the hands, more as one would treat soft woolen goods, will be found sufficient. For this reason soap paste should be used instead of soap. This can be made with any of the standard soap powders. Enough should be poured into the water to make a nice lather, and the dresses washed, one piece in the water at the time, as quickly as possible. This will be found an excellent method.

The dress should be rinsed in two or three waters, and either salt or vinegar put in the last rinsing water to prevent the colors from running; they will do more than that, however, apparently having the further power of increasing, or rather restoring, the brilliance of the colors. If the ground of the pattern is white or pale blue, a little bluing should also be added to the last rinsing water. Salt is generally used for the more delicate shades, in the proportion of a tablespoonful to a gallon of water; vinegar for the darker colors, such as blacks and purples. With helitrope or purple, vinegar will work wonders, not merely in keeping the color from fading, but in some cases restoring the pristine brilliance to fabrics already faded. In goods which have a pattern of varied colors, where one hardly knows whether to put salt or vinegar in the last rinsing water, it is a good plan to be on the safe side and use them both, in the proportion of a tablespoonful of each to a gallon of water.

Hot water starch is made in the proportion of one tablespoonful of starch dissolved in a little cold water, to as much borax as will lie on a ten-cent piece, dissolved in a tablespoonful of boiling water (it will not melt in cold water,) and a quarter of an inch of tallow candle. Pour on boiling water until it reaches the desired consistency. The dresses, if colored or patterned, should not be dipped in the starch while it is very hot. If they are wanted very stiff, the starch should not be squeezed out of them too much. In any case, they must not be wrung at all, but squeezed. Muslins esepciallly, though, should be shaken out gently before hanging up to dry, as they are liable to tear if they become clotted together too much when they are dry.

Anything that has been in hot water starch should be sprinkled before folding ready to iron, with hot water instead of cold, as the latter is liable to leave starch spots on material. After being thoroughly sprinkled, the garment should be folded with as few creases as possible and rolled up tightly, that it may be of the same dampness all over when it comes to be ironed. It is much better, though, to iron muslins and prints before they are quite dry, so that they do not need to be sprinkled; indeed, in the case of muslins with a delicate pattern this is necessary.

Unless a dress is wanted very limp, it should be dried before starching. Muslins, prints and other colored or patterned wash goods should never be dried in the sun, as everything fades much worse when it is wet. They should, however, be dried as quickly as possible, a breeze being nice for this. Closely woven goods require less starch than materials that are loosely woven.

* * *

A valued subscriber sends in the following along the same line:

Washing White Goods.

There is no color that is so becoming and certainly none that proves so economical as pure white, and the white dresses can often be worn one season without washing if they are dampened on the wrong side with thin starch water and pressed as fast as dampened, and this should be done before they become very wrinkled.

Fruit stains and mildew will often appear on white garments and table linen through carelessness, and to prevent mildew do not put anything away damp. An old stain is hard to efface, but a fresh stain may be removed by rubbing with lard and placing in the sun for several days, being careful to bring it in at night as the garment should not be allowed to get wet until the stain disappears.

If any of your white goods get yellow use two tablespoons of coal oil to a boiler of clothes, then in the last rinsing water add a spoonful of borax dissolved in hot water. Nice white goods will be improved if a little borax is put in each of the waters used, as it not only softens the water, but helps to whiten the fabric, and for very sheer materials a little borax dissolved in the last rinsing water gives them just the right degree of stiffness, and it is especially nice for fine handkerchiefs.

A white linen dress skirt is often stretched out of shape and proper length by careless ironing, and this may be prevented by ironing one way of the goods either lengthwise or across and using a tape measure while pressing to be sure that all the widths will be ironed the same length. To iron the skirt lengthwise makes it longer, and across will make it shorter.

If a garment is lace trimmed, it is best to iron all the rest of the garment first; then dampen the lace and press on the wrong side and as soon as you have finished pressing the lace pull it out to its fullest width and press again and the lace will look almost like new.—A. H.

The Oldest Savings Bank in California

FOUNDED IN 1857

The Savings and Loan Society

101 Montgomery St., Cor. Sutter St., San Francisco

CAPITAL FULLY PAID $1,000,000.00

Exclusively a Savings Bank whose policy is for ***Conservatism*** and ***Safety,*** the result of ***50 years experience.***

Deposits may be made and withdrawn by mail.

San Francisco Savings Union

Founded June 18, 1862 Northwest Cor. California and Montgomery Sts., San Francisco

Conducts a Savings Bank Business Exclusively

Capital Paid Up, $1,000,000.00. Surplus, $1,183,632.00.

Total Assets, $27,508,850.00.

E. B. POND, President.

Every facility afforded for opening accounts and making deposits and withdrawals by mail. Correspondence invited.

Paid Semi-Annually

7%

Assured Profit

We offer you Cane Sugar Lands in Mexico. Perfect title. Give 50-year contract to cultivate for you, guaranteeing 7%, paid semi-annually, until crop profit exceeds this amount. Offer these lands for cash or on easy terms.

A Life Income from Land

Sugar Plantations produce the greatest continuous yield of any known crop. Tropical Mexico stands today unmatched in soil, climate, water. We own over 9000 acres in the heart of the best section—near Tampico. You become a land-owning profit-sharer in this project. We do all the work for you.

Sugar Plantations the Most Profitable Crop in All the World

One Acre Should Produce $203.52 Annually
Five Acres Should Produce $1017.60 Annually
Ten Acres Should Produce $2035.20 Annually

GOOD LIVE AGENTS WANTED

Free Trip to Property Communities or syndicates buying 50 acres or more, may send representative to property at our expense

Some surprising figures were tabulated at the recent nut growers' meeting at Monticello, as to the acreage of commercial pecan orchards. In four Georgia and five Florida counties the area reported amounts to 6885 acres or about 140,000 trees. In this tabulation none of the seedling orchards were counted.

San Francisco Markets

SAN FRANCISC, Aug. 11, 1908.

Butter.

Hay.

Somers & Co. say:

Owing to the car scarcity which is now becoming quite apparent, shipments of hay to market have been somewhat reduced during the week ending today, the total showing 3740 tons in comparison with 4510 for last week. Although it is a fact that very few consumers are storing away a winter's supply, yet it is undeniably true that the consumption of hay on the San Francisco market is materially less than it was a year ago.

The bulk of the crop that is put up for the San Francisco market has changed hands at rather high prices which will probably mean that no decline will be in evidence until late in the spring, if at all. The great decrease in consumption, however, will probably insure the market against any radical advance over the present range.

We can give no change in today's prices from the list given during the past two weeks which we give today as follows:

Choice wheat hay..........16.00@17.00
Good wheat hay..........14.00@15.50
Other grades same..........11.00@13.00
Wheat and Oat..........11.00@15.50
Tame oat..........11.00@15.50

BEAUTIFUL ROOF EFFECT OF OLD MOORISH TILES.

A material which seems certain to entirely take the place of shingles is the latest product of American inventiveness.

It is a sheet substance composed of long tough fibres which are matted together with heavy gums having the property of never drying out nor losing their weather resisting qualities. Both surfaces of the sheet are tempered or hardened into an impervious skin that gradually oxidizes on the roof, assuming a wearing surface similar to slate. The color is a warm Indian red.

Although laid in long strips, the effect of the finished roof is that of individual, diamond-shaped tiles. This result is accomplished by an ingenious method of lapping one saw tooth edged sheet over another, the points of the upper sheet just touching the upper angles of the lower sheet. This produces a series of tiles.

An important quality of this new material, which is called Zolium, is that it will not catch fire from sparks, thus eliminating one of the greatest dangers resulting from closely built-up residential sections.

Ful linformation regarding this important invention can be obtained of J. A. & W. Bird & Co., Boston, Mass., who are the patentees and makers.

NOT EVERY ONE CAN LIVE IN CALIFORNIA.

But you can bring the finest California products direct to your door with a two-cent stamp. All this is due to the progressive spirit of the California Fruit Products Co., of Colton, California, who, after a careful investigation convinced themselves that there are thousands of families in the rural districts of the United States who use little or no California fruit because they cannot secure it readily —or what they can buy is high priced —often unclean and last year's crop.

This season they put up their dried fruit in 2-lb. cartons, 25 cartons or 50 lbs. to the case, assorted, so as to make it more convenient for a few families to club together. They have also added canned apricots, peaches, pears, plums; two dozen cans to the case, assorted. Pure extracted honey made from the blossom of the orange and sage, the finest flavor in the world; also soft shelled walnuts and almonds. They pay the freight.

Few realize the immensity of the fruit industry and other products of the soil of California, and many will be surprised to learn that last season's products amounted to 5,560,000 cases or 133,440,000 cans of fruit, valued at ten million dollars; raisins, 140,000,000 pounds; dried fruits, 254,375,000 pounds; figs, 6,000,000 pounds; prunes, 180,000,000 pounds; oranges, 30,000 cars, $20,000,000; olives, 750,000 gals., $425,000.00; olive oil, 200,000 gals., $500,000.00; wanuts, 14,000,000 pounds, $1,750,000.00; celery, 3,000 cars; cabbage, 500 cars; cauliflower, 350 cars; beet sugar, 163,800,000 pounds; butter, 5,000,000 lbs.; grain yield, $50,000,000.00. The bulk of the mustard is raised in California. In Santa Barbara county 3000 acres are devoted to it.

The California Fruit Products Company of Colton, California, will mail three colored Souvenir Post Cards free to anyone who will write them, and also to any friends whose name and address you may enclose.

POULTRY SHOW.

A poultry show will be held in connection with the Long Beach Festival of the Sea, from September 1st to 6th. Cash prizes and ribbons will be given. Entry, 25c, single birds; $1, breeding pens. Competent judges will be chosen and a competent superintendent will be in charge.

Entries close August 29th. Birds received August 31st and returned September 7th. The management promises a splendid chance to advertise stock. Let the people see what you grow, and take orders for eggs. This is going to stimulate the business. No one can afford to miss it.

J. W. Whitney, Long Beach, care of the Long Beach Chamber of Commerce, will give information.

Pomona Pressure Gates

A Great Aid in Irrigation

These gates are made similar to the ordinary slide gates except that there is a locking device interposed to lock the cover in any desired position or to press the two faces together to make a WATER TIGHT joint, from either direction when closed. The parts are very simple, only a tapering screw with a split tapering nut socket. By turning the handle to the right tightens, and to the left loosens the cover or it may be removed entirely.

Fumigation According to Latest Methods

Investigations by R. S. Woglum and Frederick Maskew of the Department of Agriculture Are Leading to Much Information as to Better Processes

FOR the past 20 years the use of hydrocyanic acid gas for ridding citrus trees of scale insects has been general in Southern California and during the past few years its use has become somewhat general in the northern part of the State. Florida seemed backward in taking up the process, preferring to trust to the spray pump or to nature through beneficial insects or otherwise, to balance up her own acount and correct conditions without expense on the part of the fruit grower.

The Southern California fruit grower is too impatient for these slower methods and has gone on using and perfecting the fumigation process. From the first there has been at times almost perfect work accomplished, practically every bug on the tree being killed. On other trees in the same orchard the failure would be complete. The reason for this has perplexed the most practical.

How It's Done.

The fumigation process consists in covering the tree to be treated with a tent of ordinary 6 or 8 ounce duck, which has sometimes been made more or less gas tight by steeping in a tanin solution, cactus solution or something similar, though some use tents without treatment. This tent was formerly a dome-shaped affair with gas pipe hoop about the bottom. Lately the tent with hoop has given way to the octagonal sheet, which is thrown over the tree and gathered in at the bottom.

When the tent is placed over the tree its cubic contents are estimated by the foreman and with this estimate as a basis the dosage or amount of the three ingredients to manufacture the gas is computed. The ingredients for manufacturing the gas are one part cyanide of potassium, one part sulphuric acid and three parts water. These are thrown together in a vessel underneath the tent after it is placed over the tree. If the estimator erred and figured the contents much greater than existed, then he caused injury to foliage and possibly loss of fruit. If, on the other hand, his estimate was too small then no bugs or but few were killed and that tree supplied enough insects to restock the orchard. The margin between burning of tree and not killing the scale is not great.

In fact, the orchardist will usually refuse to accept a job of fumigation from the contractor unless the tender growth of the tree is at least slightly "burned" in proof of thorough work.

Experts Sent.

The uncertainty of this estimating the size of the tree, together with more severe burning under certain weather conditions and many other points, more or less perplexing, impelled the orchardists to insist on some more exact knowledge of the process. The matter was taken up with the Los Angeles County Horticultural Commission nearly two years since when J. W. Jeffrey, now State Horticultural Commisioner, was at the head of the commission. The County Commission appealed to the United States Department of Agriculture asking that competent investigators be sent to study into present methods and suggest a way of securing more uniform results.

The department heeded the request, appropriating $10,000 for the work and sent from Washington Mr. R. S. Woglum of the Bureau of Entomology. Mr. Frederick Maskew, formerly inspector for the County Commission and later for the State Commission, was chosen to assist Mr. Woglum. Those two have now been engaged in the investigation for nearly a year.

Some Points Studied.

The chemistry of the manufacture of the gas, weather conditions, most economical form and material of tents, dosage and many other questions have been studied. The studies and experiments have been largely in the field with the tents and gangs doing regular orchard work; also, with special tents under control of the investigators.

One of the first points developed was that the dosage tables and the manner of determining the amount of gas required were most faulty. Several tables, to insure accuracy, had been advised, but the first step depended upon the judgment of the foreman in charge in judging of the height and diameter of the tree.

All fumigation, owing to injury to the tree where work is done by sunlight, is practiced at night. This night work makes more uncertain the estimate or "guess" of the best of men.

To eliminate this guessing and reduce this feature of the work to as near an exact science as possible, has been the effort of Messrs. Woglum and Maskew. In a large measure they have succeeded and the horticultural inspectors of Los Angeles county and many other orchardists and fumigators, listened to Mr. Woglum's address at the Courthouse last Saturday. Mr. Woglum also spoke before the Whittier Farmers' Club last Wednesday.

The Plan.

In a few words the dosage is determined as follows: The sheet or tent is graduated with painted figures on a line running over the center of the tree. The figures begin at 5 feet from the center and are graduated down each side, say, as high as 20 or 25 feet. When the tent is thrown over the trees and the figure 15 just touches the

TABLE SHOWING DOSAGE OF CYANIDE FOR PURPLE SCALE.

This table, arranged by Prof. Woglum, should be of inestimable value to fumigators. Having ascertained distance over the tree by use of tape line or marked tent as explained on next page, find the figure representing this distance in the left hand column of the chart. Then determine the distance around the tree or circumference and find its number at the top of the chart. Follow these lines down and across till they intersect. The figure there indicates the number of ounces of cyanide.

Fumigation Investigations

Preliminary report made by Prof. R. S. Woglum of the Department of Agriculture before the Whittier Farmers' Club at Whittier Aug. 12 and the Los Angeles County Horticultural Commission Saturday, Aug. 15, regarding the investigations of fumigation methods in California.

AT THE commencement of our investigations into this question, it was soon seen that there were several loop-holes in the present system, readily affording opportunity for error. In the first place, the dosage-scheduling is a system of guesswork. Measurements of the tree are made by the eye, consequently successful results depend largely upon the uniformity of the estimator's eyesight. Guess work is sometimes quite accurate, still we cannot always depend on such without sooner or later getting into trouble. Although many fumigators accomplish most excellent work there are others whose work is much less satisfactory. And I would venture to say that there are none of you fumigators present, who, although your work is held to be of a high character, have not treated some orchards in which you have done a less satisfactory job that you would have desired, and also the growers themselves would have desired. From observations which we have made we have found out that the most careful of men frequently vary as much as 50 per cent in their estimation of dosage for trees which contain practically the same cubical space when covered with a tent. This variation may appear somewhat large. We have found, however, from keeping check on our own work in the field that the eye is much less accurate in judging the size of trees than we would be normally inclined to believe.

After it once became apparent that uniformity in dosage could be secured only through determining the contents or space in a tree after being covered with a tent, and dosing the tree in proportion to this content, I worked out a scheme in which by knowing the distance around the bottom of the tent and over the top of the tent, it is possible to find almost immediately the cubical contents of any tree.

In our work in the field we first obtained the measurements around and over the tent by the use of a tape line. The determination of the distance over the top of the tent by this method is much too slow for practical use. Our energies, to a large extent, have since been bent to enlarging on and modifying this scheme, that it might be utilized in a practical way in the field. As a result, we have now come to a point where we can secure the measurements of tents entirely without the use of an instrument other than the tent and a man.

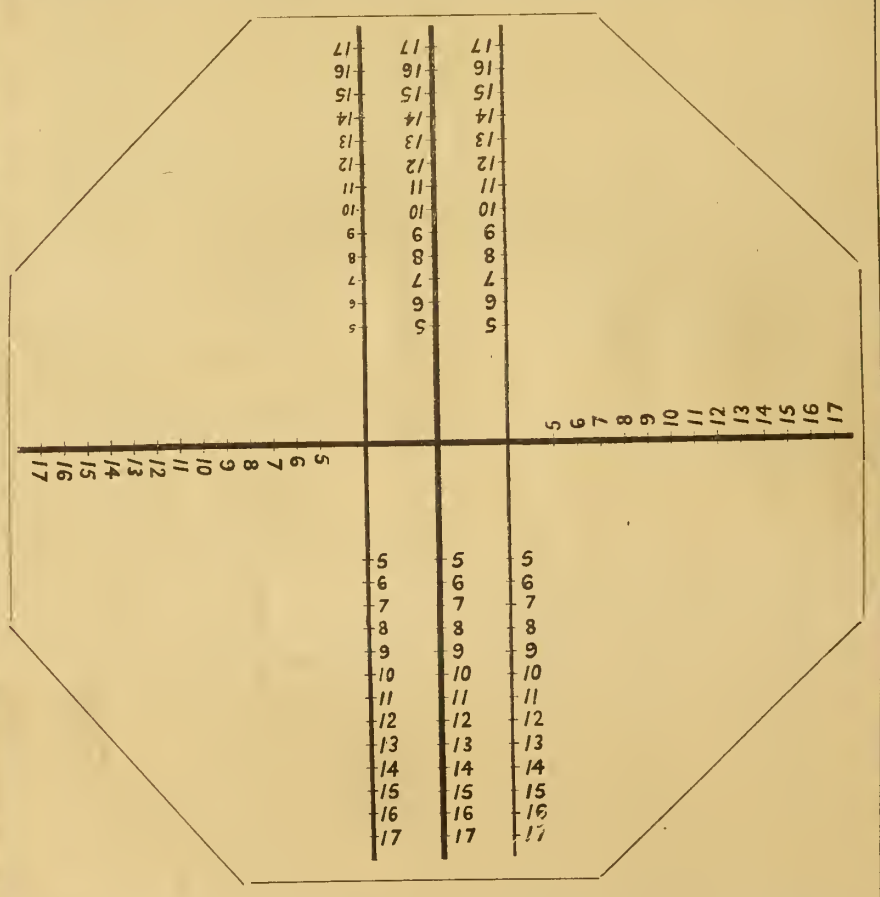
While doing fumigation work in Florida last winter I became acquainted with a system of marking tents whereby the distance over the top of the tree could be easily secured.

For obtaining the distance around the tented tree our work has shown to us that this can be done with much accuracy by pacing. The man who is to obtain the dimensions of the trees on a regular outfit should make several practice trials beforehand around tented trees in order to determine what his length of pace is, and to regulate it, if necessary. In pacing around a tree it is well to be far enough distant so that his body will not rub against the tent, say about 6 inches to a foot from the tent. The pace should be regulated to the equivalent of 2½ or 3 feet of the actual distance around the tent—preferably 3 feet if the pacer can step that distance without much exertion. In reality the pacer will be stepping slightly more than 2½ or 3 feet as he makes a circle slightly larger than that of the edge of the tent. After a half-dozen to a dozen trials most men can so regulate their stepping that they will seldom vary more than a foot from the distance as measured with a tape.

In pacing around the tent the man should also notice the reading of the

MANNER OF MARKING TENTS TO DETERMINE DOSAGE.

Each tent is in the form of an octagonal sheet. Measuring from the center and to the margin of the tent, there are graduatel dines 12 inches apart. Only one line one way will be necessary, but in ordinary work the center of the sheet may not strike the exact center of the tree, so parallel duplicate lines are placed on either side of the center. The cross line is the same and only to aid in securing exact measurement.



THE "BOSS" Tree Protecter

Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. Can be easily removed; will last for years.

Send for samples.

line running over the tent and thus secure both dimensions at once.

The Whittier Citrus Association commenced using this system with one of its outfits last month. A second outfit was put in the field about a week ago.

With this new system it can be seen that there must be some changes in the character of commissary from that now in general use in this county, inasmuch as the chemicals must be measured out at the tree. For this purpose two-wheel go-carts have been rigged up in which to carry the cyanide, acid and water.

Five men are used on an outfit—two tent pullers, one man to estimate the trees, the other two to measure the chemicals and dose the tree.

After the throw has been made the generating cart is brought to one end of the row to be dosed. The estimator paces around the tent obtaining its dimensions. A dosage-schedule, which is carried on the cart, is then examined and the dosage noted. One of the men on the commissary or cart measures the cyanide, the other the acid and water. When this is done the man measuring the cyanide holds up an edge of the tent while the acid man places the dose beneath the tree. The cart is then moved on to the next tree. Meanwhile, the scheduler has obtained the measurements of the second tree so that the dosage can be measured out as soon as the cart is hauled there without any delay. The scheduler also empties the generating pot and has it in readiness. In such a manner the work is outlined until the entire set of trees is dosed.

These two outfits using this system have been averaging a complete set of 32 tents in from 40 to 45 minutes. This would appear to demonstrate the system entirely practical from the standpoint of time, as tents are required to be left on the trees an hour. Five men are required for an outfit, instead of four as common in this section under the old system. There are, however, advantages in this new method which easily offset the cost of the extra man. The trees are being dosed with a uniform strength so that a practically uniform percentage of insects should be destroyed on all the trees in an orchard. If a dosage of sufficient strength to destroy 90 per cent of the purple scale is used, practically 90 per cent of the purple scale should be destroyed throughout the orchard; not 90 per cent on some tree and 50 per cent more or less on others, as occurs at times under the old system of guess work.

This new system practically eliminates many errors which occur under the old system; first, the guess element in scheduling; the element of variation from not measuring the water; the mixing of the dosage weighed out for the next throw of tents.

Dosage Schedule.

Having the contents of the tent, the next requirement is the dosage to be employed. For about a year now we have been experimenting almost constantly on a broad scale with problems of fumigation relating to dosage. Our work has demonstrated to us that young fruit is very susceptible to injury from fumigation until about the size of a walnut or larger. During the early part of July when the fruit had become quite that size in some orchards, experiments were carried on with a view to determining how great a strength of gas the fruit would stand at that time without injury. We found that on trees from about 10 to 15 feet in height a strength of about one ounce of cyanide to the hundred cubic feet could be used, where smaller trees would stand a slightly greater strength with impunity.

[At this point Prof. Woglum explained by use of charts and computations that the greater proportional leakage of the smaller tent is the reason for this greater strength of gas required for the smaller tent. For instance, a 20x12 tent contains 99 cubic feet or 85 square feet of tent surface which would give a ratio of leakage surface to volume of .86. A 40x28 tent would have 1040 cubic feet, 420 square feet and ratio of .40. While a 70x54 would contain 6605 cubic feet, 1445 square feet or a leakage of .22.

This larger tent would thus have about one-fourth of the leakage ratio of the smallest, hence would require a comparatively smaller dose than the smaller tree.—Ed.]

As this was the limit of dosage which could be used at that time without injury to the fruit, I prepared a schedule based on these data. In this schedule, trees from about 40 feet around by 38 feet over, to trees about 52 feet around by 34 over received one ounce of cyanide for each hundred cubic feet of enclosed space. Smaller trees received a greater and larger trees a smaller strength of dosage quite in proportion to the leakage of the tent.

Hence it can be readily seen that in order to secure uniformity of results, this leakage must be taken into consideration, and smaller trees receive more cyanide to the hundred cubic feet than the larger trees. This state of affairs has been frequently demonstrated to us in the field. When we would use on small trees a certain dosage strength with which we were able to secure splendid killing against the purple scale on large trees, the result would always be much less satisfactory on the former.

This first table which I have prepared and which is called Dosage-schedule 1, is shown on first page. It is a table of uniformity so far as I am able to prepare one at the present time, being based directly on the cubical contents of the trees, and also considering the difference in leakage in different sized trees. I do not contend that this table is accurate to the thousandth part of an ounce for every dosage, but I am inclined to believe that variation, such as there may be, is so small that in practical work in the field we will find the killing equally satisfactory in any part of the table which may be put in use. The dosage given in each one of these squares, which represents a tree of

THE COMING WALNUT CROP.

THAT the coming walnut crop will be a fine one is now assured. That is, fine as to quality and fair as to quantity. Some reports have gone out which have exaggerated as to quantity, which have been corrected by more careful canvass of the situation.

The crop will probably be five or possibly 10 per cent larger than last year. There will be probably but a very few No. 2s, as the nuts are well separated and will be large and well formed.

Wm. Crowther, of Placentia, president of the local Walnut Association, reports trees and nuts of that section now in best of condition. He handed us the following, which appeared in San Francisco Daily Commercial News recently:

Captain G. F. Smith, president of the Santa Barbara Walnut Growers' Association of Santa Barbara, is stopping in town for a few days, and in the course of conversation gave his views of the walnut situation in the South. While it is true that the acreage planted to new trees has been quite largely increased within the past few years, it must not be forgotten that it takes a walnut tree ten or twelve years to produce a crop of any amount, and the recent planting will have no effect on the output for several years. The crop this year promises to be a good one, but not so big as some of the trade perhaps have stated. It will not vary very much from that of last year, although the quality, based upon the outlook today, will be the best ever harvested in California. The nuts are scattered uniformly over the trees; there are but very few clusters, and there will be very few No. 2's, a smaller percentage than for many years past. Weather conditions have been ideal and the quality will probably be the best for years.

Captain Smith declines to discuss prices, but believes that at the proper time the association will name figures that will be attractive to the trade and at the same time move the entire crop. He realizes that conditions do not warrant as high prices as prevailed last year, neither does he believe that the low prices talked by some of the shippers interested who are anxious to depress values will rule; in other words, an average between the price of two years ago and that of last year will probably rule, but at the proper time to name prices the associations will be found in line with conditions as they exist in this country and in Europe.

When each association is ready to name prices Captain Smith states that while they welcome all the information they can get from their brokers, they are not in sympathy with advice which is solely interested and given them with a view to depressing prices in order that agents may have an easier task in moving the crop, as the associations are in close touch with European correspondents, so that they are abundantly capable of naming a price that will be right and just and that will move the crop.

Speaking of associations, Captain Smith calls attention to the fact that the walnut associations of California are the only co-operative organizations of growers that have ever held together in this state for any length of time. The associations have been handling walnuts in Southern California for the past fifteen years, and during that time their main effort has been to improve the quality of the stock shipped and enable the growers to obtain a fair return for their investment.

Exaggerated reports have been spread from time to time throughout the Eastern and Coast papers as to the profits of the walnut growing in this state; when, as a matter of fact, the net returns to the growers have not been as great as those of the deciduous fruit growers in the same district. One reason for the success of the associations is the fact that they have been conducted at a minimum expense, and the members have received the maximum benefit. The officers and directors are all large growers, many of them either active or retired business or professional men, and they realize the necessity of not only maintaining the high standard of grade established, but also naming prices from year to year warranted by market conditions.

Captain Smith is very optimistic regarding the future of walnut growing in this state, and believes that the associations will continue in their present policy of considering both the grower and the jobber when naming prices.

THE GYPSY MOTH.

The gypsy moth (Porthetria dispar,) brought by accident into the United States nearly forty years ago at a point near Boston, has spread throughout Eastern Massachusetts into Southern New Hampshire and Southwestern Maine, and has also made its appearance at isolated points in Rhode Island and Eastern Conneticut. Its damage to the large forests in this portion of the country has been very great, and its threatened spread into the timber forests northward has been for years the cause of much alarm. It appears in countless numbers, and the defoliation of the trees two years in succession frequently brings about their death. This is especially true of conifers. The loss it has occasioned by the actual destruction of forests, shade trees, fruit trees and other vegetation is very great and must run into the millions of dollars. It has caused a great loss in the reduced value of real estate in the portions of the country infested. It has brought about an enormous pecuniary loss to holders of property from the expense of the war that has been waged against it. The State of Massachusetts alone has spent over $2,000,000 in efforts to control the pest. When the insect was first discovered it is safe to say an immediate expenditure of less than $100,000 would have stamped it out.—Yearbook of the Department of Agriculture, 1907.

Table Grapes in Transit and Storage

Report by A. V. Stubenrauch of the Department of Agriculture and now investigating the grape shipping conditions at Lodi.

DURING the past seven years the Bureau of Plant Industry of the United States Department of Agriculture has conducted investigations to determine the factors that govern the successful shipment and storage of fruits. There has been included in these investigations apples, pears, peaches, plums, oranges, grapes, and small fruits.

It has been shown that the different kinds of molds which cause the most common forms of decay in these fruits while in transit and in storage are unable to penetrate the sound, normal skin of the fruit. These molds generally gain entrance through mechanical abrasions produced in the preparation of the fruit for market. It is not unusual to find 10 per cent. of apples showing cuts or abrasions in the skin. Small fruits are more commonly injured, while oranges frequently show from 10 to 50 per cent. of the fruit with the skin cut by the clippers in severing it from the trees or by rough handling of the fruit in the packing houses. It has been demonstrated that by careful handling in the picking and packing of oranges under commercial conditions the injuries can be overcome and the decay can be almost wholly eliminated.

Investigations With Table Grapes.

During the past two years the storage investigations have been extended to the table grape industry of California. The investigations were started with two objects in view: A study of the factors which may affect the keeping quality of the grape in transit and in storage on the one hand and, on the other, the possibility of extending the marketing season of California grapes by cold or common storage with a view to the possible replacing with the California product of the $1,500,000 annual importation of fresh Spanish grapes.

The preliminary investigations have shown that most of the injuries to grapes in handling occur at the point where the berry joins the stem—the pedicel. Other forms of injury are broken and cracked berries produced by rough handling or excessive squeezing in packing. The pedicel breaks are perhaps the most difficult to control, especially in tender varieties. The simple bending of a berry to one side may cause a break at the pedicel, frequently so slight as to be nearly invisible but sufficient to allow the entrance of the mold. These broken berries under proper conditions of heat and moisture will show mold in a few days. After the mold has started it will continue to develop and spread in the ordinary grape package even at a temperature near the freezing point.

Cold Storage Experiments.

A few examples will suffice to show how great an influence careful handling and packing may exert on the keeping qualities of table grapes. Sixteen of the leading varieties of table grapes, some of which are grown commercially in California, were used in cold storage experiments. All the grapes were handled with the greatest possible care and were packed in different ways, after which the fruit was held in cold storage. The varieties studied are the Flame Tokay, Muscat, Thompson Seedless, Ferrara, Emperor, Verdal, Black Prince, Malaga, Cornichon, Huasco, Bowood, Pizzutella (Lady Finger,) Perruno, Chasselas de Fontainebleau, Zabalkanski and Almeria.

Table 1 shows some of the results obtained in the cold storage experiments in 1906 and 1907. The open crates were firmly packed, but not high enough to necessitate squeezing. The table also shows results with the same varieties packed in tight boxes with fillings of ground cork and redwood sawdust, and, for comparison, the Flame Tokay and Emperor varieties packed for commercial shipment without extra precaution in handling.

TABLE.—Length of time table grapes were held in sound condition in cold storage in 1906 and 1907.

Variety.	Packed in ordinary open crate.	Packed with cork filling.	Packed with redwood sawdust filling.
	Days	Days	Days
Flame Tokay	40 to 60	65 to 100	.....
Muscat	30 to 40	90 to 100	110
Malaga	30 to 35	90 to 115	120
Black Prince	20 to 30	70	.....
Black Ferrara	40 to 60	90	.....
Purple Cornichon	45 to 60	80 to 140	150
Verdal	20 to 25	100 to 110	130
Pizzutella	20 to 35	70 to 90	110
Almeria	80 to 100	95 to 150	170
Flame Tokay, commercial pack	*10 to 20	.....	.....
Emperor, commercial pack	**30 to 40	.....	.....

*Contained 25 to 40 per cent of injured berries. Delay of four days between picking and storing.

**Contained 10 to 12 per cent of injured berries.

The commercial packs of Flame Tokay and Emperor were the usual high pack. The grapes were subjected to quite severe squeezing, although both lots were extra cleated. The percentages of injured berries were too high to make long keeping possible.

The length of time given in the table refers to the limit of first-class condition as indicated by freedom from mold, decay and dropping from the stems.

All varieties shown in the table with the exception of the commercially packed Flame Tokay and Emperor were packed soon after picking and were shipped immediately. Not more than thirty-six hours elapsed between

picking and placing the fruit in cold storage.

It has been shown in the investigations with other fruit that one of the most important factors in the successful handling of fruits either in storage or in transit is quick shipment or quick cooling after the fruit is harvested. The sooner the fruit can be cooled after it leaves the tree or vine the longer time it will continue in first class condition. This is especially true where there are any appreciable mechanical injuries in handling. It has been shown with oranges, for example, that after a delay in shipping or cooling of two to four days, the decay in transit may be from two to five times greater than under immediate shipment or cooling, depending upon the amount of mechanical injury in the fruit. These factors of quick shipment and quick cooling are likely to be as important and perhaps more important with grapes than they are with oranges, for the reason that the ordinary grape package offers ideal moisture conditions for the development of molds and if the proper heat conditions are present molds are almost sure to occur. In the case of the commercial pack of Tokays shown in the table, mold had already made its appearance on the arrival of the fruit at the storage house four days after picking. These crates were shipped by express and consequently had no cooling in transit.

The data presented have an important bearing on the problems dealing with the safe handling and transportation of table grapes. They show that under proper conditions of handling and packing the more tender varieties may be held in sound condition beyond the time required to reach distant markets.—A. V. Stubenrauch, Expert in Fruit Transportation.

A Flea Beetle Injuring Hops in British Columbia

Written for California Cultivator.
BY PROF. H. J. QUAYLE, WHITTIER.

A flea beetle (known to science as Psylliodes punctulata,) widely distributed over the northern part of the United States, and hitherto little known as a pest of cultivated crops, has been seriously menacing the hop industry of British Columbia during the past year or two.

The E. C. Horst Company has 520 acres of hops at Sardis and Agassiz, B. C., from which they normally obtain a crop of nearly 500 tons. This year, on account of the ravages of the flea beetle, the total crop is estimated at about seventy-five tons, a loss of 425 tons, or 85 per cent. Figuring the price of hops at 20 cents a pound, this loss to this one company will aggregate $178,000. Another yard of 96 acres in the same section will suffer a proportionate loss. A third yard of 45 acres will yield a full crop, due to the persistent efforts of the owner in fighting the beetle, and this will represent an outlay of from $10 to $15 an acre. The above yards represent the total acreage planted to hops in the Chilliwack and Agassiz valleys of British Columbia, and while not large, the industry is an important one to the few engaged in it.

The beetle, which is very small, not measuring more than one-tenth of an inch, appears in the early spring and begins its attacks on the hop vines just as they are bursting through the ground. This early attack of the beetles before any appreciable amount of foliage appears, is one of the points that make any control work difficult. The injury is due to small circular holes being eaten out in the leaf or cavities gouged out of the tender growing tips. The leaves are completely riddled with these holes and in severe cases only the large ribs of the leaf are left. Vines that got a start in the spring and grew to a height of three or four feet were seen to be completely stripped of foliage and killed to the ground.

Nothing was known of the younger stages of this insect, and during the writer's visit to the section it was his chief mission to discover these if possible. The eggs, larvae and pupae were consequently found in the ground at a depth of from 3 to 6 inches, the larvae feeding upon the roots of the hop, and undoubtedly other plants growing in the yard.

As for control measures, nothing practical and efficient has yet been found. There are two chief points that militate seriously against an effective remedy. One is the continual emergence of the beetles from the ground, making their capture by jarring or other mechanical means of but little temporary value; and the other is the rapid growth of the hop vines that makes it necessary to frequently repeat a poison spray. Either of these remedies would be fairly effective with a similar insect under ordinary circumstances, and they are effective with this one, but only temporarily, and the frequent repetitions necessary make its control too laborious and costly. An entomologist of the Oregon Experiment Station is at present engaged in an investigation of this flea beetle, and with a more complete knowledge of its life history, a vulnerable point of attack may yet be found. H. J. QUAYLE.

Apricot pits commanded about $15 per ton this year.

To San Jose for a Business Training

It is a city of progress; of pure air and water; of moral and intellectual environment; a city of great opportunity for the young man and woman with a practical training.

We Prepare for Success by teaching thoroughly the following business subjects:

California Horticulturally

THE EUCALYPTUS IN NORTHERN CALIFORNIA.

THE eucalyptus is having a boom that is not confined to the Southern end of the State, but reaches its entire length. More inquiries are now being made about the culture and care of eucalyptus than about anything else, and several big projects are now under way to plant out large areas in these trees. There is no question but that the industry is one that will pay, with the present and prospective shortage of hardwood timbers in the East, and the constantly advancing price thereof.

The eucalypts offer all that is required to fill the demand, and California will practically have a monopply of these growths. Yet there is a prospect of a good deal of wild cat speculation connected with it, and it has been announced that these trees will do well on poor soil, where nothing else will grow, and without water. The fact is that the eucalypts require good soil and abundant moisture if they do well, although their roots penetrate down great depths to moisture. Eucalyptus growing will pay, but no business on earth will pay without care and without proper conditions.

THE STATE FAIR.

Filcher, the great show man, declares that the State Fair to be held at Sacramento this year will be the greatest ever, and whoever has seen the preparations being made will believe him. There have been a greater number of applications for space in the Pavilion this year than ever before and a larger number of counties will be represented. The State Fair had, before Filcher's administration, degenerated into a poor "hoss show," but it is once again becoming the "State Fair," truly representative of the agricultural and material interests of the whole commonwealth, and this will be more so this year than ever. The stock exhibit on the new agricultural grounds will be the greatest ever made in the State.

This will be the last exhibit to be made in the old Pavilion on the Capitol grounds, as that building is doomed, and will be torn down immediately after the ending of the fair this year.

GYPSUM ON HARDPAN.

A practical farmer in Kern county has been experimenting with hardpan for some years past, and now comes out with a statement that he can dissolve it with a liberal application of gypsum. It is stated that the pulverized gypsum has a chemical affinity for the hardpan and acts as a solvent. If this statement is true, the discovery is a valuable one, for there are thousands of acres of land in this State whose productive qualities are lessened or destroyed by the presence of hardpan near the surface, and which could be made exceedingly fertile were it possible to overcome it at any reasonable cost. Gypsum or land plaster has been recognized for ages as a most valuable fertilizer under certain conditions. If it will now dissolve our hardpan it will be doubly valuable.

FRESH FRUIT SHIPMENTS.

So far shipments of fresh fruits, the greater portion of which go from Sacramento, have greatly exceeded those of any previous season, and in all probability the end of the season will see them nearly double those of last year. Table grapes now form the bulk of the shipments, and owing to the heavy crop and the large new acreage coming in, these will be unusually large. Shipments of grapes will continue until the middle of November, or until heavy rains come. Prices have not been so good as they were last year, but at the same time have averaged fair for the season.

A GROWING INDUSTRY.

There is no branch of agricultural industry that has made more rapid strides in the past decade than has the dairy industry. This is largely due to improved methods and the bringing of grazing sections of the State within easy reach of trade centers by the building of steam and electric roads. The present valuation of the annual output of the dairies of the State is $26,000,000 and this is increasing every year. The principal dairy sections now are in the mountain valleys and the coast counties. In these sections there is a greater certainty of green feed at all seasons than in the interior valleys. Mendocino, Humboldt, Lassen, Sierra, Napa, Sonoma and San Mateo are at present the chief dairy counties of the State. It is pleasant to note that the olden style of preparing and shipping milk to market has given way to modern methods. In the past the milking yard or corral was too filthy for description, but when it was discovered that milk was one of the great sources and distributors of disease, sanitary methods came into vogue, and the milk offered in the markets today is comparatively free from dirt and disease germs, although, in many cases there is still room for improvement.

A FAIRLY GOOD SEASON.

Owing to the very heavy shortage in the rainfall last winter there was much fear early in the season that crops would be a total failure in Central and Northern California. Late spring rains, however, did much to relieve the situation, and now at the end of the season we find that matters might have been worse. The grain crop, of course, is very light, hay has turned out fair, and most other crops fair to good. So, after all, it may be called a fairly good season.

General Agriculture

AGRICULTURAL RESEARCH.

DIRECTOR E. J. Wickson of the University of California Agricultural Experiment Station has prepared an outline of "original researches and experiments" as required by Act of Congress of March 16, 1906, which will be pursued with the special appropriation made by Congress for that purpose. The outline has been approved by President Wheeler and the work will be immediately entered upon by the members of the station staff mentioned in connection with each undertaking.

By E. W. Hilgard and R. H. Loughridge: Continuation of an investigation of the occurence of chlorosis on citrus trees in the Porterville region and its relation to marly subsoils, with extension of study to adjacent districts in which it is found to occur, including also effects upon deciduous trees and experiments to prevent injury due to excess of lime.

By H. M. Hall: Completion of study of ornamental and economic plants in the Santa Barbara district, to determine their characteristics, climatic requirements, uses, etc.

By R. E. Smith, B. H. Smith and F. L. Yeaw: Continuation of investigation into the occurence of the "California peach blight," including identification and nature of fungi causing shot-hole blights of peach, apricot and almond, and the relations of these diseases.

By A. R. Ward and C. M. Haring: Continuation of studies in the artificial immunization of cattle against tuberculosis, based upon history of 36 calves already purchased and vaccinated, as compared with an equal number of uninoculated calves to be kept with them as a check, under same exposure, etc.

By M. E. Jaffa: Continuation of metabolism experiments with poultry, income and outgo of nitrogen and determination of heats of combustion of feeds and excretory products to ascertain the availability of different highly nitrogenous foods.

By G. W. Shaw and Rachael Corr: Continuation of laboratory and field study of cereals from the points of view of the influence of environment upon gluten content of grains; the cultural cost of material being met by provision for maintenance of cultural stations by State appropriation in cooperation with the United States Department of Agriculture.

By R. E. Smith, E. H. Smith and F. L. Yeaw: Continuation of study of methods of infection and spread of pear blight bacillus; life history of the causative organism is to be more closely studied under local conditions from a bacteriological point of view, because under local conditions it departs from its behavior elsewhere; also with reference to more effective treatment.

By R. H. Loughridge: Continuation of study of tolerance of plants for alkali soils. Observations of plant growth and determination of nature and amounts of alkali, with discussion of relations.

By C. W. Woodworth: Study of life history of the Argentine ant, particularly those features that have a bearing on the extension of the infested areas and on the use of ant remedies. A laboratory is now being equipped in the East Oakland infested area.

By E. W. Hilgard and Charles H. Lipman: A study of soil bacteria under arid conditions and the relation of irrigation thereto.

By R. E. Simth and O. Butler: An investigation into the nature of certain "physiological" plant diseases like the various forms of gum disease of citrus trees, etc. This work will be done at the Southern California Plant Disease Laboratory at Whittier.

By W. T. Clarke: Determination of causes of sterility of almond trees and relation thereto of cross-pollination, weather conditions, etc. Field and laboratory studies.

By H. J. Quayle: Detailed study of red and yellow scale of citrus trees, including breeding and environment experiments to determine factors responsible for two forms and their geographical distribution. This study will be made at the Whittier Laboratory and in Southern California orchards.

By E. B. Babcock: Investigation of nature and origin of "walnut-oak" hybrids with hybridizing experiments, as a basis for study of physiological principles involved.

Live Stock and Dairy

BREEDERS' ASSOCIATIONS.

THE United States government has organized the different draft horse associations that conform to rules by giving them charters. This is bringing them into order. Some of the States of the Middle West have rules governing stallions that stand for the public service. Everywhere the grade stallions are being weeded out and it is a needed reform, for the photographs show spavined, curbed and ringboned stallions that have been used in public service. It seems strange that a man would think of raising a colt from one of the many animals that are shown in bulletins A California farmer would hardly tolerate them on his farm as work animals and never think of propagating anything so worthless.

Mixed Breeds.

There are many stallions of mixed breeding in the United States that are causing some trouble at this time. A case at hand is as follows: A fine draft mare, from imported sire and dam, registered as a Percheron in America with both sire and dam registered in France and in the United States, was bred to a fine looking horse that had a name and number and also was called a Percheron on his printed card. The owner, looking at his papers, knew they were not from the association in which his mare was registered, but the mare was the offspring of imported stock and, therefore, was eligible to any Percheron society. Now comes in the need for clearing up the associations. This stallion was not a Percheron at all but a French Draft. The colt could not be registered. The parties owning the French Draft horse used the word Percheron as a catch for breeders, probably, as the neighborhood had many Percheron mares. The French Draft breed is a good one and it is strange that anyone owning a good French Draft stallion should care to assert he was a Percheron. It is very hard to beat the top line of a good French Draft animal. Then they are bay in color and many prefer that color in horses.

Gray.

There are a few old fashioned people who prefer a gray draft animal. There is a club formed to breed an American gray draft horse. They are crossing with care the breeds to try to catch the perfect points of each, the disposition of the Percheron and his willing gentleness with the better back of the German and French animal. Then the longer pastern joint, particularly in the hind feet, is a point in which the American Gray draft is hoped to excel other animals. The many changes that have come in the breeders associations should make any one breeding their full blood mares ask for the name of the association or society that issued the papers; then he should write to that society to know if the animal in question is still on their lists. He may find that the papers have been cancelled.

Frauds.

Scandal has come to one great breed of cattle by the fraululent methods of a man who stood high as a scientific agriculturist. This man, supposed to be without guile, belongs to the class of people who are unmoral rather than immoral, for they do not seem to have any sense of right.

I cannot imagine doing anyone a greater evil than selling them cattle of falsified pedigrees. It simply brings all one's careful study of mating to naught. The result will not follow true if the blood lines are not true. All sorts of wild freaks will crop out if the persistent breeder pushes the breeding along. Whenever there come a few freaks from any mating, the wise breeder regards the mating as wrong and cuts out that particular sire. Then forever afterwards there lingers a suspicion of the blood. I personally do not like the Netherlands in the Holstein. I would not buy an animal having any of the crosses very close in, all because I had a sire, Netherland Clothile, all of whose heifers I discarded as not being what I was desirous of having in the herd.

Results of Frauds.

In the case before cited, the association affected promptly cancelled every one of the cows and all the offspring to the remotest degree. Now what a loss. Many purchased a calf with, perhaps, only an eighth of this tainted blood, and yet all their cattle lost at once whatever good blood they had because of the small per cent of base mixture. Do not become a breeder of registered stock unless you know you are strict enough never to register any animal of whose breeding you are not absolutely sure. If the heifers are not all marked at birth while at their dam's side, use them as milkers, but do not register them. If it is a male make it into beef and no one is any the worse off. Think of the queer position in which many of the men today find themselves, who have innocently bought and sold cattle now thrown out of the herd books.

Orders of Merit.

It is proposed to have a National Order of Merit for cows. These records will be founded on the performance for a year, a full three hundred and sixty-five days. The tests are to be made under the State Agricultural College or the experiment stations two days in each month by an official and then the owners' weights to be accepted for the intermediate milkings. The proposed entrance test to the Order of Merit will require that a two-year-old cow produce in the year 6500 pounds of milk or make 250 pounds of butter fat. The increasing requirements would be found by adding one-tenth of a pound each day to the 250 pounds of butter fat, until at five years of age the maximum requirement for entrance is 360 pounds of butter fat or 10,000 pounds of milk. These tests are for all pure breed dairy cows. The Association of Breeders is made responsible that the cattle are pure breed. When the government finally does issue the certificate to the cow, her photograph is attached to it. This is a further guard against fraud, a la Chinese certificate plan. I hope the photographs of the cows will look more like them than the picture on the Chinese certificate resembles the Celestial who delightedly shows it as "Me picture, all samee American."—M. E. Sherman.

Well prepared country boys are wanted by the great business houses of San Francisco. Write us for information. San Francisco Business College, 733 Fillmore St., S. F.

Hemet has dried about 1000 tons of apricots this year.

FLYFOE

That is just what it is. Sprayed on stock it kills or keeps off all those awful pests, flies, mosquitoes, gnats, etc. Do you realize what that means? Use it and note how much easier it is to keep your stock in condition and how comfortable they are. Sprayed on your cows the increased milk yield will many times pay for its cost. You should use something of the kind and

FLYFOE

will be found the most effective "fly bouncer" on the market.

If your dealer does not keep it, we will ship a 1-gallon can at $1.25 or a 5-gallon can for $5.00, and will prepay the freight. If not fully satisfied with it money refunded. Made by the

CORN CUTTER.

I would like to tell Mrs. Sherman and your subscribers how to make an inexpensive corn cutter.

My father made one which we used successfully in Iowa some years ago, two men cutting two rows as fast as horse can walk.

Take a wheel 16 or 18 inches high (we used one made like a roller, 20 inches broad;) to this attach two 2x-8x6 feet long 20 or 24 inches apart. Back ends serving as runners; front ends attached to wheel; cover with one inch boards. Then take a piece of iron 30x36 inches, (we used old scraper bottom) cut into diagonally; attach to sides of sled, wide ends back. To this bolt knives made of old crosscut saw having back sharpened. Make sled wide enough so corn rows will strike knife near front end. Put seat lengthwise on sled, one man sitting on each side; gather and hold corn and as horse walks it will be cut off.—O. C. Woodward, Chico.

SALE OF SHORTHORNS.

A rare opportunity to purchase high bred shorthorns is offered this year in the combination sale of the famous Roselawn herd and the Eakle herd, both at Woodlawn, Yolo county. More properly, instead of a combination sale, each is an independent sale, but arranged to follow each other.

The Roselawn herd owned by Mrs. W. B. and T. B. Gibson will hold its third annual sale on Sept. 11, beginning at 12:30 at the ranch 1 mile south of Woodland. There are 70 head of shorthorns in this bunch.

H. P. Eakle and R. M. Dunlop will sell 66 head the following day, Sept. 12 at 12:30. Busses will meet all trains at Woodland. Lunch will be served.

Geo. Bellows will auction both herds.

Catalogues may be had by addressing either Mr. Gibson or Mr. Eakle.

PASPALUM DILATATUM

King of dairying and fattening grasses. The great Australian drouth resister. Primest heavy seed direct from the grower, 4 lbs. (ample for trial) post free, $2.00. Full information.

C. F. JULIUS

Central Bucca, Coffs Harbor, New South Wales

Berkshires--Shorthorns

My Berkshires took every blue ribbon and Gold and Silver Medal in the female classes. Choice pigs at low prices. G. A. Murphy, Perkins, Cal.

A good many farmers object to raising hand-fed calves because it is such a bother to teach them to drink. The secret of the whole matter is in letting the calf become hungry before attempting to give it milk. It is a good plan not to give the calves anything until they have been away from the cow twenty-four hours and sometimes longer. It is then an easy matter to teach a calf to drink. If it is a little obstinate at first let it suck the fingers a time or two, gradually taking the fingers away, but in most cases this will not be necessary. Under all circumstances deal gently with the calf.

The collars and saddle pads should be cleaned every day, to remove the filth. If they are left all gummed up they soon gall and make mean sores. Dust and sweat will ruin a horse's shoulder in two or three days.

Milch Goats in California

Written for California Cultivator.
BY MISS B. A. R. STOCKER OF ARROYO GRANDE.

FOR many years I had hankered to have a goat, but was much in the dark about the whole question, and never saw one offering itself for sale. Like a great many other folks in a small way I used canned milk or went without.

Sometimes in talking with Swiss or German people I got a little light. They had only praise for the useful little animal; all about it was so easy and so good.

At length one September day a German came and offered me a nanny kid for a trifling outlay; took me over to his place to see it. It was six months old; red and white like a toy cow, entirely irresistible and I succumbed on the spot. I put her in the hen yard and she used to race around there and dance on the roofs of the houses to the admiration of the neighborhood.

But it would still be a long time before my toy cow gave any milk. And soon we heard of another German family who had two for sale, one of them coming fresh in December. They would not part them; and finally I took the two. The second one was hornless, of Togenburg blood (which none of us then knew anything about) trained to go in harness and drag a little cart. She also would have kids in spring. This one (the least valued, most valuable as appeared later) I gave to some boys who wanted a driving goat. And when the kids came and were partly grown they were given away to lead a band of sheep, for folks around there had no use for goats. Later when we got the government bulletin, Bulletin of Bureau of Animal Industry No. 68 on the subject, it dawned upon us that we had been throwing out silver spoons in the dishwater, and there was hasty hunting for the lost treasure. Happily they were all recovered and reinstated where they should be as founders of a flock of milkers. One of those first kids would pass for a Togenburger, exactly like the pictures of some of the best typical milk goats of Switzerland.

Meanwhile my other goats had been an unfailing source of comfort and delight. They proved to be excellent stock, giving plenty of beautiful milk; and the kids were most entertaining.

Anyone that keeps a few goats is apt to become very much attached to them, and the goats reciprocate it. They have feelings more deep and tender than anything else I have noticed, unless it might be a woman.

There is a great deal to learn in this industry, and we are lucky if there is any one around of whom we can ask questions at time of need. If you want to know whether keeping a goat proves a satisfactory venture as a rule, try to buy one when she is in profit, and see how tight her owners hold on, and how kindly they express their wish that you may find one elsewhere.

BONE SPAVIN.

From the Report on Diseases of the Horse issued by the Department of Agriculture we quote: We are fully persuaded that but for the loss of the time wasted in the treatment of purely imaginary ailments, very many cases of bone spavin might be arrested in their incipiency and their victims preserved for years of comfort for themselves and valuable labor to their owners.

To consider a hypothetical case: An early discovery of lameness has been made; that is, the existence of an acute inflammation—of periostitis—has been detected. The increased temperature of the parts has been observed, with the stiffened gait and the charateristic pose of the limb, and the question is proposed for soluttion, "What is to be done?" Even with only these comparatively doubtful symptoms—doubtful with the non-expert—we should direct our treatment to the hock in preference to any other joint, since of all the joints of the hind leg it is this which is most liable to be attacked, a natural result from its peculiarities of structure and function. And in answer to the query "What is the first need?" we should answer rest, emphatically, and as an essential condition, rest. Whether only threatened, suspected or positively diseased, the animal must be wholly released from labor, and it must be no partial or temporary quiet of a few days. In all stages and conditions of the disease, whether the spavin is nothing more than a simple exotosis, or whether accompanied by the complication of arthritis, there must be a total suspension of effort until the danger is over. Less than a month's quiet ought not to be thought of—the longer the better.

Good results may also be expected from local applications. The various lotions which cool the parts, the astringments which lower the tension of the blood vessels, the tepid fomentations which accelerate the circulation in the engorged capillaries, the liniments of various composition, the stimulants, the opiate anodynes, the sedative preparations of aconite, the alterative frictions of iodine—all these are recommended and prescribed by one or another. We prefer counter-irritants, for the simple reason, among many others, that they tend by the promptness of their action to prevent by anticipation the formation of the bony deposits. The lameness will often yield to the blistering action of cantharides, in the form of ointment or liniment, and to the alterative preparations of iodine or mercury. And if the owner of a spavined horse really succeeds in removing the lameness, he has accomplished all that he is justified in hoping for; beyond this let him be well persuaded that a "cure" is impossible.

For this reason, moreover, he will do well to be on his guard against the patented "cures" which the traveling horse doctor may urge upon his credulity, and withhold his faith from the circular of the agent who will deluge him with references and certificates. It is possible that nostrums may in some exceptional instances prove serviceable, but the greater number of them are capable of producing only injurious effects. The removal of the bony tumor cannot be accomplished by any such means, and if a trial of these unknown compounds should be followed by complications no worse than the establishment of one or more ugly, hairless cicatrices, it will be well for both the horse and his owner.

At this point a word of explanation in reference to the operation of firing may be appropriate. The operation is one of simplicity, but is nevertheless one which, in order to secure its benefits, must be reserved for times and occasions of which only the best knowledge and highest discretion should be allowed to judge. It is not the mere application of a hot iron to a given part of the body which constitutes the operation of firing. It is the methodical and scientific introduction of heat into the structure with a view to a given effect upon a diseased organ or tissue by an expert surgeon. The first is one of the degrees of mere burning. The other is scientific cauterization, and is a surgical manipulation which should be committed exclusively to the practiced hand of the veterinary surgeon.

Either firing alone or stimulation with blisters is of great efficacy for the relief of lameness from bone spavin. Failure to produce relief after a few applications and after allowing a sufficient interval of rest should be followed by a second, or if needed, a third firing.

GETTING THE COLT ON ITS OWN RESOURCES.

The weaning of the colt is a task which requires not so much the application of definite rules as of common sense, careful observation and patience. The phrase "horse-sense" would not be an inappropriate substitute for these latter terms. This is for the simple reason that no two colts are alike, yet each must be carefully looked after, for each represents a cash as well as a time outlay.

Much can be done previous to the time the colt and its dam are separated that will tend to prevent a restless condition in both, but especially in the colt. The first one of these is to keep the colt from running with the mare in the fields and while at work. When a youngster once forms the habit of running loose, or has, in popular phrase, become a law unto itself, there is trouble ahead for the person who attempts to restrain it in all its coltish ways and independence of action. The only way to handle colts is to have a box stall for each, opening into a common lot which is so fenced that when confined therein the youngsters are pretty well shut off from the rest of the world. However, this kind of an arrangement is more rare than

common, else there would be fewer colts coming to maturity with so many ill manners. If a colt grows up with a decided respect for fences and gates, that attitude will generally remain through life, much to the satisfaction of his owner. In the absence of box stalls the next best thing is to turn the youngster loose in a closed building, the barn generally being most available, though it is far from being a satisfactory place.

Where two colts can be weaned together it results in an advantage to all concerned. The more that they can be kept in company the better, as colts soon develop a fondness for each other that is marked, and which is to an extent a substitute, no doubt, for the maternal affection. After the first separation the farther out of each other's hearing the dam and offspring can be kept the less restless either will be. This is possible only on a large farm or where there is a pasture which is well fenced and which does not come up to the barn yards, as bad results are sure to follow when mother and colt recognize each other over the ordinary pasture boundary line.

In the matter of feeds, oats lead all other grains and the youngster will quickly learn to eat it, if from no other place than its mother's feed box. In its individual ration some corn may be added to the oats if the colts have good mouths, though sometimes trouble is experienced in getting youngsters to eat as much as they should on account of tender gums or slow cutting teeth. If this condition exists soaked or steamed grains may be fed for a time, but they should never be allowed to sour. A good condiment of some kind is favored by many and no doubt it serves a good purpose. All agree on salt, however, the same to be accessible at all times.

It never loses any time to give colts proper attention, not only as regards nutrition, but as regards their manners. Some people claim that a colt makes a better horse when reared without learning the friendship of man. We have broken many colts, however, and seen many others broken which were, as youngsters, taught to the halter, and with few exceptions they took to the harness when grown as an old horse in a few days.

A good many men will for the first time in their lives have pure-bred colts to wean this year. They will require probably a little better care than has been given those of nondescript breeding. They are superior to the scrub colt simply because they are from stock which is superior by reason of better care. The colt represents only the start, and what the finish will be is largely in the hands of the owner. If the kind of encouragement suggested above is given, the finish should be very satisfactory to both the eye and the pocketbook.—Iowa Homestead.

COTTON SEED MEAL FOR DAIRY COWS.

One of the Eastern experiment stations has been experimenting to ascertain the value of cotton seed meal when fed to dairy cows in conjunction with corn ensilage. From the experiments conducted thus far with this combination the following conclusions have been reached:

1. Cotton seed meal when fed in conjunction with good corn silage may be fed to the extent of from five to six pounds per cow daily without affecting the health of the animals. Indeed such a ration appears to keep cows in an unusually good state of health.

2. A ration consisting of cotton seed meal and good corn silage is consumed by cows with great relish which is in no way lessened when the feeding of such a ration is continued for a period of five months.

3. No bad effects were noticeable from the practice of feeding cotton seed meal and corn silage separately. On the contrary such a practice appears to have distinct advantages over the common practice of mixing the meal with the roughage. Our results, therefore, tend to disprove the prevailing belief that heavy concentrates like cotton seed meal will act detrimentally on the health of the cows when fed unmixed with more bulky feeds.

4. Cows fed exclusively on cotton seed meal and corn silage for a period of five months exhibited no craving for dry roughage, but always preferred silage to good hay.

5. According to the herd records the cows yielded more milk and butter fat during this experiment than during any corresponding period in previous years.

6. Cotton seed meal and rich well-matured corn silage constitute an excellent ration for cows yielding from twenty to thirty pounds of milk daily.

7. Cotton seed meal and corn silage form by far the cheapest dairy feeds available to our dairymen. The cost of such a ration is only slightly more than half as much as that of the common dairy ration now fed in this State.

8. Our good results in the exclusive feeding of cotton seed meal and corn silage as a dairy ration are undoubtedly largely attributable to the fact that the corn silage was made from well-matured corn rich in grain, making it especially rich in carbohydrates. Unless silage is especially rich in grain, a ration consisting entirely of corn silage and cotton seed meal will lack in non-nitrogenous matter.

The amount of cotton seed meal used in this case; namely, from five to six pounds per cow daily, will seem large to the average dairyman, though the fact that it was used without any injurious effect whatever is significant. Mill feeds of all kinds are high in price at the present time, and it would not surprise us if they should remain high for many months to come. As cotton seed meal contains upwards of 40 per cent of protein, it will be apparent that compared with bran, for example, it makes an inexpensive source of flesh-forming material, as bran contains only about 16 per cent of protein.—Farmer and Stockman.

PURE BRED SHEEP ON NATIONAL FOREST RANGES.

Many sheep breeders, especially those of the East, will be surprised to learn that pure bred registered sheep may be raised and run on the open ranges of the west in large bands without any diminution in the grade or quality of the product as compared to the parent dams and sires with which the flocks were started. The first requisite is that an entirely satisfactory range, properly protected from the intrusion of other flocks and upon which there is certain to be the necessary amount of forage, water, etc., must be assured. At the present time this condition exists only upon private lands and within the National Forests of the west, which are under the administration of the Forest Service.

A noteworthy example of what can be accomplished in breeding high-grade sheep on properly controlled open range is that of Allen Bros. who graze about 3000 head of registered Cottswold sheep within the Uinta National Forest in the State of Utah. These bands are the increase of about 200 head of prize winning stock from the Royal Stock Show in England and the International Show at Chicago, purchased and imported to Utah by Allen Bros. since 1892. They have been grazed within the Uinta Forest since 1903, upon ranges which are practically ideal for sheep grazing purposes, being well watered, grassed and shaded, and protected from the grazing of other sheep. Careful breeding is developing a pure bred type of Cottswold entirely adapted to western range conditions, yet equal to anything raised under fences in the eastern United States or in European countries.

This is a sample case that demonstrates what range control within the National Forests is enabling the stockmen of the West to do. There are quicker and greater returns to be secured from the raising of high grade stock than from inferior mongrel breeds, but in many sections stockmen have hesitated to invest in registered sires and dams because of the uncertainty of securing ranges upon which feed and water are absolutely assured and without which such ventures would not be so remunerative or so successful as the running of inferior grades of stock better adapted to the severe range conditions that are commonly encountered because of overstocking and lack of control.

On National Forest ranges the number of stock allowed is only what the range is sufficient to sustain under all conditions, and a stockman who secures a permit to graze stock on these ranges may embark upon the business of raising high grade cattle and sheep with every reasonable assurance of success.

Never choose a dairy cow because she is fat, sleek and a beauty. "Beauty is as beauty does." The fat and sleek dairy cow doesn't do the handsome thing. The scraggy, bony cow does. Therefore, she is the real dairy beauty.

The Tulare County Fair Association will have a novelty feature this year in vaudeville performances to be given by various sections of the county, all to be by local talent and a prize to be given the winner.

EXCLUSIVE
Tubular ADVANTAGES No. 8
Perfect Separation
Perfect separation not only means the "most butterfat," but means the delivery of the smoothest velvety cream, unfrothed and unchopped.
Exclusive Tubular Advantage No. 8 is the means that insures "perfect separation," both as to clean skimming and the production of smooth, velvety cream. Our Catalogue tells you the scientific and mechanical reasons why.
To convince you that the Tubular skims the cleanest, we offer to place one in your dairy and guarantee to cut in half any record any other machine may be able to make.
If other makers could make separator bowls like the Tubular, there would be no other kinds made. It is absolutely the most perfect bowl ever invented. If it were not, we could not make such a broad guarantee as stated above.
Now you want the best, don't you? A postal brings Catalog No. 260, giving more fully this broad guarantee. Write for it today.

MORE MILK—MORE MEAT
IF YOU USE LILLY'S BEST FLY KILLER
I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.

THE FARMERS' CLUB.

In the northern part of the state the Grange has secured a strong foothold and is a power for good, used in the interest of the farmers. Socially, financially, and often politically, it has been used to correct evils which otherwise the farmer would have been compelled to endure. Long may it continue to grow and increase in power.

In the southern part of the state the Grange has never secured a foothold, there being none whatever south of the Tehachapi. Its place has been taken by the farmers' club, which in turn has at times held its institutes or general gathering of all farmers' clubs. These clubs have accomplished much for the farming class. We believe the present fertilizer law, which has corrected many abuses suffered by farmers, had its birth in the Claremont and Pomona Farmers' Clubs. These two clubs are the oldest in Southern California, and as a result of their efforts many others were organized. One of the latest of these to organize was that of East Whittier, which began its existence last week with a fine membership and much enthusiasm. It will doubtless be in line to take up any work which looks to the betterment of the farming class.

ALASKA WHEAT.

There recently came to the Cultivator an advertisement under the ordinary guise of a communication which the Cultivator was "permitted" to use; but unfortunately it was consigned to the waste basket with much other such matter. We note that some papers up and down the state, and even in Oregon, are publishing this stuff and usually without comment. That, of course, does not indorse all that the circular claims, but at the same time may prove misleading to some farmer. The circular claims that this wonderful wheat, which is a recent discovery, will yield the enormous average of 200 bushels per acre, or to be more exact, we believe it was 222 bushels in at least one case. It intimates that the wheat was discovered in Alaska, and says: "The United States paid eighty millions for Alaska, and yet the great gold payment Alaska has returned sinks into insignificance when compared with Farmer Adam's Alaska Wheat." And so on with a lot more of similar statements. We now note that Prof. W. H. Olin, agronomist of the Colorado Experiment Station, writes:

"I am pained to know that some unscrupulous persons are seeking to deceive our industrious farmers, desiring better milling wheat, by foisting upon them the so-called 'Alaska Wheat' as a superior milling wheat, of high yielding quality.

"Through the courtesy of Mr. Halsey C. Rhoades of Denver, Prof. Knorr and myself have been privileged to make a study of this wheat in the field. We seeded it by the side of known Egyptian, or Seven Headed wheat, and have studied both wheats from germination to maturity. The two wheats are absolutely identical. After harvest we will make the milling test of both wheats and publish a bulletin on the full results.

"Suffice to say now, Egyptian, Seven Headed, Mummy, or Alaska wheat (the various names by which it is known) is a soft spring wheat, not desirable to Colorado millers, and where grown to any appreciable extent in this state, will be discounted or docked in price by Colorado millers. Instead of being a very desirable wheat for milling purposes, it is quite the reverse, since it has high starch content and low gluten content of poor quality. Farmers are warned to avoid this wheat as they would a pestilence.

"The local reporter of the 'Rocky Mountain News' has already published in said paper two articles exposing this fraud on the public, and we trust it may have a tendency to check the sale of this undesirable wheat to farmers."

Further than the above letter of Professor Olin, the Cultivator has no information. But the tone of the advertising circular and the fabulous claims made for the wheat are sufficient to cause farmers to be wise and not pay $5 a pound, or any other fabulous sum, or make any extensive test with this wheat until more is learned about it.

A COLLISION.

The management of our State Agricultural Fair has seen fit to advertise "a great locomotive head-on collision" at the coming state fair. It may be that this is an agricultural product which is worthy of the energetic pushing and advertising which seems to be given it. One of the engines is said to have a record a mile long and has "even crossed dangerous bridges and dashed through dark and gruesome tunnels." This famous engine and another are to smash into each other at "full speed" at the "great State Fair of 1908."

Seriously, this exhibition may attract some of the rabble from the city of Sacramento, but we believe the energy which is being expended upon it could vastly better have been devoted to something more along agricultural lines. Collisions, sword swallowers and a few other like attractions may be necessary to bring a crowd to a small eastern fair; but we believe a State institution supported by the taxpayers' money should be on rather more dignified ground.

The anti-race track campaign is warming up in earnest. The biggest part of the fight will be at the polls at the coming election. Those who favor the enactment which will prevent this disgrace to the state are asking candidates for the assembly and state senate as to their attitude. This is beginning at the right end of the proposition and we imagine will accomplish results.

SHOOTING THE KIDS.

Melon growers in Kings and Tulare counties who have been exasperated by youngsters engaged in the gathering of their melons after the moon had disappeared below the horizon, proceeded to protect their own property, using the shotgun as a means of moral suasion. Several boys, many of them from the "best families," were filled uncomfortably full of birdshot, and the result is a disrupted neighborhood, an arrested farmer, and a condition which will cost the man who used the gun several times the amount the whole melon patch is worth.

Now it is not to the credit of any of us, but probably if we were to take a vote amongst the older men of the state as to the number who had never stolen a melon when they were young, there would be but few hands go up. This has possibly unfitted us all to sit on a jury for the reason that it seems to have been regarded as a moral principle that every younster should steal melons and still be exempt.

Be this as it may, it must be admitted that the farmer who has grown a crop in spite of drouth, insects, fungous and other diseases, and driven as good a bargain as possible with the commission man or buyer, is justified in a degree of exasperation to find his crop disappearing because of midnight marauders. The fact that such practices are winked at by many of us and that the boys are of good families cuts but little figure with the man whose crop is destroyed. Conditions are different from "when we were boys," but as true as that is, we believe the farmer should take a less bloodthirsty course and teach a severer lesson to the boys, which would make them less of heroes and hold them up to the community in their true light. It will be less costly to the one raising the melons and of more value in elevating the morals of the state.

Since the above is put in type we note in the Los Angeles Times that a Covina rancher has solved the problem to a nicety. He had himself elected constable. Now he quietly sits under the shade of a tree till the boys are "pulling' the fruit when he flies out and "pulls" the boys. They are taken to court where they are fined, the constable gets his fee of $1.00 and mileage of 25 cents per mile. He has already had five boys fined, has received his fees and is lying low for more. It has proved far more profitable than the melon crop.

CROP CONDITIONS.

On August 1, crop conditions in the United States were in the aggregate somewhat better (2 per cent) than a year ago, but slightly (1 per cent) below a ten-year average condition on that date. Of the crops that are above the average may be mentioned winter wheat, hay, cotton and tobacco. Corn, barley, rye, buckwheat, apples and flax are slightly below the average, potatoes about 5 per cent below, and oats nearly 10 per cent. below the average.

Shop Talk

SUBSCRIPTIONS.—Orders are received at this office almost daily to discontinue or change the address of the **Cultivator** without giving the name of the post-office to which the paper has been going. Much confusion and delay would be avoided if every one would bear in mind that we have a large list and that it is impossible to find names without knowing the postoffice address. The list is indexed according to location and not according to name. so all can see the necessity of paying attention to this suggestion when sending their orders.

CANDY BOOK—Orders are still coming in rapidly for the recipe book, "Home-made Ice Cream and Candy Book." It is surely a very attractive little book and is appreciated by **Cultivator** readers. Better join the crowd and send in your renewal for a year in advance according to the ad on another page.

SUNSET MAGAZINE.—All **Cultivator** readers should keep in mind the offer made last week giving the **Sunset** and the **Cultivator,** one year each, both for $2.00. This is a very reasonable and valuable offer and is good with renewals or new subscriptions. Better take advantage of it while fresh in mind and order at once through this office. The **Cultivator** makes no profit out of this offer, but makes it only to induce prompt renewal and to be of service to its readers. Cut out and mail the order blank found on another page.

Agricultural Notes of the Pacific Coast

Northern California

Gridley cannery is running with a force of 400 people.

Eldorado county is appealing for a cannery to handle its surplus crop.

Yuba City Cannery has already packed half a million cans of peaches.

The Sacramento River is said to be lower than ever known in the month of August.

Beet fields near Hamilton City will average from 18 to 29 tons per acre this season.

Biggs wine grape growers have been offered only $8 to $10 a ton for their grapes on the cars.

The California Fruit Canners' Association at Yuba City is appealing for more help to aid in its work.

Some beets bought at the Alta California factory at Hamilton City, have averaged as high as 25 per cent sugar.

Some Santa Rosa hop growers disposed of their hops at 9 cents a pound. The market seems to be very uncertain.

Some berry and small fruit sections near Redding are suffering from lack of water to carry the fruit through the season.

A fruit grower at Acampo has a new fruit, claimed to be a cross between peach and nectarine, which he has named the Peacherine.

The Feather River Canal Company, having an irrigation system near Gridley, expects to tap the Feather River this fall and have water for the coming season's irrigation.

The Selby Smelting Company of Solano County has been closed by order of the Board of Supervisors, owing to injury to fruit and garden crops from the fumes arising from the chimneys.

Apple growers of Sonora, Tuolumne county, are much disturbed over the appearance of pear blight in their apple orchards. Wholesale cutting back has been given the trees hoping to save them.

The Lake County Bee charges the setting of a serious forest fire, which caused vast damage, to the carelessness of hunters, or worse, to the cupidity of hunters in trying to drive game from the forest.

It is reported that the Sutter County Almond Growers' Association has disposed of its output to the Guggenheim Company, and while no prices are given, rumor has it that in the neighborhood of 12 cents will prevail.

Fruit growers near Winters have much trouble with Japanese contractors who had agreed to handle the fruit for the coming season. The Japs were unable to meet the conditions made by the immense crop and had a shifty way of evading their contracts.

Sonoma county poultrymen are seriously handicapped by the high price of feed this year and the further fact that eggs and poultry have sold lower than formerly. This has resulted in a very material reduction in the number of laying hens kept by most poultrymen.

The intake of the new dam built recently by the Butte County Canal Company was injured by a washout, and at first it was thought the farmers would be seriously damaged by the shortage of water, but the break was found to be less extensive than at first thought.

Central California

CORRECTION.

In the items of Central California last week an exasperating error occurred in which it was stated that the "Corcoran Sugar Factory burned." That this was a typographical error was shown by the remainder of the item which stated that tne management expected to manufacture 100,000 sacks this season. How "began its run" was changed into "burned" we do not know and regret the error.

The dairy inspector of San Jose has tendered his resignation.

Tokay grapes at Lodi promise good returns this year.

Thompson Seedless grapes in Sanger, Fresno county, are bringing fair prices.

Some potato land near Visalia, Tulare county, has yielded 146 sacks to the acre this season.

The creamery at Salinas, Monterey county, now turns out about 1800 pounds of butter daily.

A small number of citrus trees in Visalia affected with yellow scale are to be given a thorough fumigation.

Acreage of beets near Salinas is smaller than last season, but the crop is said to be in much better condition.

The soil survey work of the Department of Agriculture will be taken up in the Pajaro valley in the near future.

Santa Clara valley grapes promise to be of exceptionally fine quality. There has been practically no mildew this year.

Irrigators near Lindsay, Tulare county, have been compelled to lower tneir pumps on account of the receding water table.

A short irrigation season in much of the San Joaquin valley has been necessary because of the earliness of the dry season.

The Chamber of Commerce of Lodi is appealing to the growers to be careful in the growing of the finest of fruit only and culling vigorously.

Prune growers are discussing the probability of a good price for the coming prune crop. Many prunes have been injured by the sun's heat.

Apple shippers of Pajaro Valley have made application to the Southern Pacific Company for an emergency freight rate of 75 or 85 cents. The regular rate is $1.

Tulare County Agricultural Fair will have a modern dairy pavilion and an exhibit along dairy and creamery lines, that will surpass anything of that nature ever held in the valley.

County Veterinarian Browning of Santa Clara county has made an energetic campaign against the disease of anthrax in cattle and all animals vaccinated have proved immune.

It is rumored that a tract of land in Tulare county is to be subdivided and made the home for a colony of colored people. A feature will be an agriculture college for the young of the negro.

The hot weather prevailing for some time in the San Joaquin valley has been so intense that it is feared that many raisin grapes have been cooked and will make inferior raisins. At least the output will be much short of that of last year.

Southern California

Orange county honey season has been closed.

Imperial Valley has shipped over 20 cars of grapes.

Orange county ships about 2500 cars of oranges and lemons.

Oxnard claims to have the only eucalyptus floor in America.

Anaheim Walnut Association reports many applications for membership.

The prune crop this year is estimated to be less than 25 per cent normal crop.

Brawley is appealing for the establishment of a creamery and cold storage warchouse.

The Pacific Coast consumed about 400 cars of Imperial Valley's melon output this year.

Ranchers on the Irvine ranch, Santa Ana, are cutting black-eyed beans. The crop is only fair.

Huntington Beach shipped over 400 tons of beets to the Alamitos Sugar Factory one day.

Inglewood, Los Angeles county, is planning for a water melon day within the next week or two.

Mountain streams of most parts of Southern California are drying up much earlier than usual.

It is estimated that the dried apricot crop from Ventura county this year will aggregate 2100 tons.

The output of dried apricots from Ventura will be by a large margin the most extensive crop ever shipped.

One Huntington Beach ranch averaged 22½ tons of sugar beets per acre, much of which tested an average of 20 per cent.

Total shipments of Imperial melons aggregate 1954 cars. This includes 100 cars from Coachella and Yuma. Last year's total crop was 664.

Farmers at Corona, Riverside Co., are working for a more perfect water service and hope to have the pipe lines filled with water within a short time.

Grain growers of Imperial valley are already considering the early planting of grain for the next season's output. Some will be planted as early as September.

The sugar factory at Oxnard reports the beets of exceptional quality this year and a fine grade of sugar is being manufactured. The average percentage of sugar is 20.65.

Highland orange growers are looking for more extensive irrigation rights, it being found that the former supply is hardly sufficient as the groves come into full bearing.

The Lake Hemet Water Company has provided its zanjeros with motorcycles, each of which will be expected to make about 50 miles per day in the duties of turning on and shutting off water.

Covina ranchers are beginning their fall fumigation and will give exceptionally heavy fumigation for red, purple and black scale. There are over 100 men engaged in various outfits in that valley.

Agricultural Park, which has been in litigation between the directors of the old District Fair Association and the City of Los Angeles, has finally been awarded to the city and will be made into a public park.

The Coast

Portland exporters are buying wheat freely at high prices.

Colfax grain fields are yielding an average of 37 bushels of wheat per acre.

Oregon wool commands the top of the market in Eastern wool buying centers.

Wheat growing sections of Oregon are elated over the dollar wheat market again.

The Portland hop market is lifeless as yet, but hopes are entertained of a keener interest.

Forest fires of vast extent have been sweeping over the Shoshone Forest Reserve in Idaho.

Palouse, Washington, has marketed its first load of new crop wheat, which tested 58 pounds per bushel.

A half million bushels of wheat were shipped from Walla Walla, Washington, in two days last week.

Oregon will ship over a thousand cars of apples this season, 500 of which will be from the Hood River district.

A large number of men, working under the direction of forest supervisors, fought forest fire for three days near Tacoma, Washington.

Fraser valley fruit, of British Columbia, has been used for export to England and is commanding highest prices in that market.

Nearly all of the fairs of the northwest are making a strong effort to secure a representative agricultural exhibit for this fall's shows.

The Rocky Ford melon campaign this season was a very great disappointment in that the crop was light and the returns unsatisfactory.

Oregon Agricultural College at Corvallis has just issued its annual catalogue. This school is rapidly securing the reputation of being one of the finest in the west.

California vegetables are commanding fancy prices in Phoenix, but a campaign is under way by which it is hoped Arizona will produce more of its own "garden sass."

A cherry tree of the Royal Anne variety near Newbery, Oregon, is seventeen years old, and from it the owner took this year 2600 pounds of fruit which sold for $125.

It is now claimed that the fearfully destructive fires of British Columbia which caused the destruction of Fernie and other towns and cost many lives, were caused by incendiaries.

It is proposed amongst members of the grange that a strong campaign be made to increase the membership in Idaho. This organization has never held a strong position there.

The Fruit and Vegetable Growers' Association of Eugene, Oregon, is a co-operative organization which has succeeded admirably in disposing of the fruit of its members this year.

Owing to intense heat in the harvest fields near Washtucna, Washington, horses were prostrated by the heat, and in some cases died in such numbers as to embarrass the harvesting.

The Farmers' Co-operative and Educational Union at its recent meeting at Garfield, Washington, adopted a resolution pledging members to handle grain in bulk as soon as possible.

YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

BREEDING FOR GREATER EGG PRODUCTION.

AT THE Maine Experiment Station some nine years ago, the station authorities outlined an experiment, the initial purpose of which was to find a way to breed poultry so that an increase in egg production might be possible. In order to get at this knowledge a specific method of breeding was tried during a period of nine years. From time to time reports have been issued regarding this experiment which have given the general public the impression that the system being employed was resulting in a gradual but marked increase in the general average productiveness of the station flock. These reports have been given wide publicity by poultry editors, poultry writers and others, until it has become an accepted fact not only in this country but in foreign countries as well, that the work at the Maine Station was demonstrating that the way to build up a strain of heavy layers was to breed from the heavy layers. Consequently many of the breeders of so-called utility stock have bought birds from the famous 200-egg hens of the Maine Experiment Station. And their advertisements have notified a confiding public that eggs from their yards were from hens whose mothers, grandmothers and great-grandmothers, etc., laid 200 to 250 eggs yearly; but when these eggs were bought and hatched they produced pullets that laid 75 to 100 eggs annually in spite of their record-breaking ancestry. Now comes Bulletin No. 157 of the Maine Experiment Station, written by the director of the said station, in which he tells us that the claims made regarding the station's success in breeding layers have been largely overdrawn.

Extracts and conclusions from the bulletin are as follows:

"The amount of variation in regard to egg production is substantially the same at the end of the selections as at the beginning; that is to say, after nine years of selection with respect to egg production the birds breed no truer to a definite type of egg production than at the beginning of the experiment.

"The general trend of the average annual egg production has been slightly downward." This is shown by the following record of the flocks for the different years:

Year and pen.	Birds completed the year.	Eggs laid.	Actual average production.
1899-1900	70	9,545	136.36
1900-1901	85	12,192	143.44
1901-1902	48	7,468	155.58
1902-1903	147	19,906	135.42
1903-1904	254	29,947	117.90
1904-1905*50 bird pens	283	37,943	134.07
1905-1906*50 bird pens	178	24,827	140.14
1906-1907*50 bird pens	187	21,175	113.24

"There is no evidence of any increase in the average production of the flock.

"At the beginning of the experiment there were relatively few 'drones' in the flock. The relative proportion of such has not changed.

"The quality of high productiveness cannot be regarded as any more a fixed characteristic of the station's strain of Barred Plymouth Rocks now than it was at the beginning of the experiment.

"It is an unfortunate fact that the averages published in the earlier reports of this station were in several cases in error, so far as can be learned from the records themselves. The causes of these errors fall into two categories, namely, a faulty method of handling the statistical material; (b) arithmetical mistakes."

Careful consideration of the results set forth in this bulletin points to the fact that there is a large amount of variation among individual birds in respect to egg production. The range of variation is from zero to approximately 250. The amount of variation is substantially the same at the end of the experiment as in the beginning. That is to say, after nine years of selection, with respect to egg production, the birds breed no truer to a definite type of egg production than they did in the beginning.

It will be recognized by every stock breeder that this is an important fact to be taken into consideration in passing opinion on the value of the method of breeding poultry that was tried in this experiment. The general conclusions regarding the results of the breeding experiment, as quoted from the bulletin, are as follows:

"The practical conclusion to be drawn from the results of this breeding experiment seems to the authors to be clear. It is that the improvement of a strain of hens in egg producing ability by selective breeding is not so simple a matter as it has been supposed to be. Nothing could be simpler than breeding from high producers to get high producers. But if this method of breeding totally fails to get high producers—in other words, if the daughters prove not to be like the mothers in egg production—it cannot fail to excite wonder as to whether the simplicity of the method is not its chief (possibly its only) recommendation. Anyone who makes a thorough first-hand study of an extensive selection experiment carried out, as was this one, by the so-called German method, without testing of the congener power of the individual organisms, cannot fail to be impressed, we believe, with the fact that the improvement of a race by selective breeding is a vastly more complicated matter than it is assumed to be by those who maintain that one need only to breed from the best to insure improvement. The supposed 'facts' of heredity on which the practical stock breeder (working for utility points) operates are in very large part inferences rather than facts. What is needed more than anything else for the advancement of the stock breeding industry in all its phases is an accumulation of definite knowledge of the fundamental principles of the heredity process. All breeding operations must be based on the laws of inheritance in organisms. The practical stock breeder is able to work out the applications of these laws for himself. What he most

needs is broader and deeper knowledge of the laws themselves. This knowledge must come from thoroughgoing, purely scientific investigations."

POULTRY BREVITIES.

Do not feed one kind of food alone, as wheat, corn or barley. Such a diet lacks balance.

* * *

Hen lice are of many kinds, but the one species that gives the most trouble is the gray mite.

* * *

It never pays to keep culls a day longer than is necessary to get them into marketable condition.

* * *

The cause of 50 per cent. of the failures in poultry keeping is inability to reproduce the laying stock.

* * *

As a rule hens that are past two years old are not profitable layers and should be disposed of previous to going into moult.

* * *

Whole barley is an excellent poultry food, but if hens have not been used to eating it they will have to be taught to do so.

* * *

Laying stock need not be fed as often as growing chicks, but they should be fed at regular intervals and on egg producing food.

* * *

If the farmer, by systematic culling of his flock, can get greater uniformity, higher fertility, greater vigor, more rapid development and better quality of meat he makes a gain worth striving for.

* * *

Bumblefoot.

Can you tell us through the Cultivator what is the matter with the feet of our hens? We have 3 Plymouth Rock hens that have sores on their feet. The foot swells on the bottom, pus forms and there is a core like a boil which, left, gets hard. The hens eat well and seem to be in fairly good health.—E. J. F.

This is what is known as bumblefoot. It may arise from one or more causes. A bruise on the foot, resulting from high roosting may give rise to it.

Some authorities have claimed that it is due to tuberculosis and in many cases doubtless is. If anything of this character is suspected the natchet is the only remedy, and unless the cause is directly traceable to some injury it is well to assume that the trouble is of a serious nature and a safe procedure is to kill such birds.

The following treatment may be adopted. Open the abscess with a sharp knife, wash out well with warm water containing carbolic acid. Apply powdered boracic acid and keep on clean straw a few days.

Do not use a bird that has had bumblefoot for breeding purposes. —S.S.T.

* * *

Geese.

Do geese lay the year round or only in the spring? We are thinking of getting a few, just for our own pleasure, not as a speculation, as we have a good place. Would you advise a setting of eggs or a pair of fowls? —Amateur, Lakeside.

With geese the breeding season begins about February 1st, though some geese will begin laying as early as December, then stop and begin again the first of February. They will lay from 12 to 20 eggs before becoming broody. If, as soon as the goose shows an inclination to set, she is confined in a small coop and kept there for two or three days with water for drink, but no food, and then liberated, she will begin laying again. She can be made to lay a third clutch of eggs by preventing her sitting and in all will lay from 40 to 50 eggs annually. I think it would be more satisfactory to start with a pair of geese rather than buy the eggs.—S.S.T.

MOULTING.

Many breeders look upon moulting as the test period of the fowl's life. In a measure this is true says a writer in Successful Poultry Journal. Very often those birds we have looked upon as our best "go to pieces" during moult. Usually a fowl that passes through the moult in good physical condition, holds its color well and shows no noticeable ill-effects therefrom is a safe one to tie to. Those that show an appreciable failing in any particular following the process should be disposed of, as they are not desirable to breed from.

The usual period of moult is from midsummer to early fall, depending upon the condition of the birds and the care they have received. Exceptionally early hatched pullets will often moult the first season, in late fall, however, usually following a period of laying; especially is this true with some of the Mediterranean breeds. Early hatched fowls, as a rule, other things being equal, will moult the following season earlier than those hatched later. Very late hatched pullets that do not come into maturity until late in the winter will continue laying until late summer before going into moult. In cases of this kind the moulting is so late in the season that cold weatner comes when the fowls are in poor health and insufficiently protected. Suffering, disease and death often result from exposure at such times and many poultry raisers refrain from hatching late in the season on this account. Forcing fowls for laying will often put off or prolong the moult. The locality, of course, will govern the time of moulting somewhat, but if the fowls do not show a tendency to go into moult in due time to insure their having a new coat of feathers before cold weather, efforts should be made to induce it. If they are laying cut down the food supply to one-third the usual amount and if in a fat condition, less than this will do no harm. Continue this light feeding for two weeks. Egg laying will cease and the fowls will lose in flesh somewhat, both of which are desirable. Then start in gradually to increase the amount of food. A sudden change from scant to full feeding would be disastrous. Let the ration include as great a variety as possible of good wholesome food, such as would build up and keep in good condition a growing or grown fowl. Be generous, but do not stuff. This change will affect a fair proportion of the flock in the manner desired—start the process of moulting.

If allowed to bring off a hatch of chicks the hen will usually moult, when if "broken up" as soon as she shows broodiness the moult would be put off for some time. In the desire to get all the eggs possible from the flock we often push the birds to the limit and consequently they do not start to moult when they should and are seriously handicapped in the process, either by the double strain of laying and moulting at the same time, or from being weakened by excessive laying through forcing. Some fowls will lay and moult at the same time without apparent injury, but it is not desirable. We want our flock to be composed of birds of the greatest possible vigor and full and complete in feathering, hence we must so surround them during the period of moult that it will cause no more of a strain upon them than nature intended.

We will not attempt to specify any certain foods, as we do not believe there is much in the theory that one kind of food affects a certain portion of the anatomy, while another kind another portion. At least it is not of sufficient moment to be of practical value to the great majority of poultry raisers. What is of greater importance is feeding as great a variety as possible, including plenty of various kinds of green food, also animal food—beef scraps, fresh meat or green cut bone, and some milk, if it is to be had at a reasonable price. In this way the fowls are given such a variety as will afford them the necessary elements for feather growing. Their natural instincts, if not perverted by too unnatural and unhealthy suroundings, will guide them to choose that which is best for their needs. Fowls on the range have a better opportunity to satisfy their natural cravings than those confined.

Avoid an excess of corn in feeding white fowls, but on the other hand, birds that are of a golden hue in any sections may be improved in color of plumage by corn of the yellow variety. It will also improve the color of yellow legs.

Fowls, too, at this period should be sheltered from sudden storms and from the hot sun. An old orchard is an excellent place for fowls in moult, or a grove of trees, bushes of any kind, a patch of corn or sunflowers, anything that will partially protect them whenever the fowls desire it.

ADVANTAGE OF HOPPER FEEDING.

A writer in Reliable Poultry Journal has the following on the hopper method of feeding fowls, and although written from an Eastern standpoint, can be readily made to conform to California conditions. Where the Eastern poultryman uses corn we find it advisable oftentimes to substitute barley. When doing so we should remember that corn is richer in fat than barley, otherwise the composition of corn and barley is quite similar.

I use the hopper method of dry feeding, which is a great saving of labor, and keep a hopper each of oyster shell, charcoal and a large one of a mixture of bran, corn chops and prepared meat scraps before them all the time. I have never had a bird to overeat; in fact, they seem to do better, the hens lay better and the young chickens grow faster.

The whole grain is fed in litter in the scratching pens; the young chickens that have free range are fed their whole grain in hoppers. I have never had a hen too fat to lay, as they get plenty of exercise in hunting for the whole grain. Young chickens fed by the hopper method are never stunted in growth, as the weaker ones have the same chance as the stronger ones, consequently are not tramped to death, besides the labor it saves in mixing mashes, which alone would make the dry feeding popular. I make my own hoppers, and they give as good results as the ones bought, and at very little cost. To make them I take a box two feet long, one foot wide and one foot deep, put a hinged cover on it and cut three holes on each side about three or four inches in diameter and about four to eight

High Priced EGGS

Are what all poultrymen like to get during the fall and winter; but without the very best of health in the flock and a good variety of sound, wholesome feed it is hard to get such eggs.

Nature requires that hens have a rest just prior to and during the molting period; the result is a scarcity of eggs, with higher prices, and a larger profit for those who can overcome the difficulty. The one that can get eggs during the fall will be just that much ahead of his neighbors and others who fail to do so, which in the end is the difference between success and failure.

COULSON'S EGG FOOD is the feed that will turn failure into success by enabling you to secure eggs in the fall and winter while prices rule high.

Improvements have been effected in the composition of the **EGG FOOD** during the past year, so that it is now richer in the various nutrients required by the laying hen, and is a better feed than ever before.

"THE RIGHT WAY," our booklet fully describes **COULSON'S IMPROVED MASH EGG FOOD** and other balanced rations for poultry and gives full directions for feeding and care of poultry from the time they are hatched, together with care of sick chicks. If you have no copy of it, you should drop us a line today; a postal card will bring it to you.

We have agents selling our poultry foods in nearly every town in California. If you cannot obtain what you want from your dealer, write to us and we will tell you where to get it.

inches from the bottom, according to size of chickens they are intended for.

I had fifty hens in 1907 and they laid 600 dozen eggs. Fifteen of them set and raised chickens and turkeys during the spring, which took considerable time during the natural laying season. I never fed any egg foods, or any condiments of any kind, but just fed good, wholesome food and plenty of green stuff, or boiled vegetables; plenty of fresh water, and kept everything in a sanitary condition. The best and easiest way I have ever tried is to clean the houses once a week if possible and to do the work thoroughly. I would rather have things cleaned up once or twice a month and have it done well, than to have it done oftener and not done so thoroughly, for success depends on thoroughness of doing things, and doing it when needed to be done—not putting it off until a more convenient time. In the poultry business, procrastination is the thief of success, and success depends largely on not neglecting the small things that are so important to the welfare of the chickens.

Coal oil and lard are excellent for scaly legs caused by parasites. A scaly-legged fowl is a detriment to any flock, and this is the time of the year when they are apt to be overlooked.

It is a bad plan to throw out whole eggshells where the hens can find them. First you know they will be picking into the whole eggs. Better smash the shells up just as fine as you can.

CROP-BOUND CHICKENS.

Chickens cannot assimilate a concentrated ration. They must have grit and coarse foods, says Mrs. S. B. Titterington, in the Des Moines Homestead. It will not do to depend altogether on what grit they can pick up on free range. It has been a long time since I fed hardboiled eggs to little chicks. It did not work well with me. The reason that it is not what they need seems obvious. The last thing before leaving the shell while hatching, the chick absorbs the yolk of the egg. If feeding is done before this yolk is assimilated, harm will result to the delicate digestive organs. Since the chick has had the yolk to care for, why should it be given more egg, especially in a form hard to digest? Oatmeal also has a tendency to produce the very trouble of which many poultry men complain. Pin-head oats are the least objectionable form of this food, but I hold with a constantly increasing number of poultry raisers who contend that oatmeal in any form is almost poison to little chicks. Oat flakes is the worst form, packing in the crop and producing bowel trouble. My opinion in this matter is based on personal experience, so is not mere theory.

The commercial chick feed is almost an ideal food, as it digests easily, and is not concentrated. It seems probable that the trouble known as crop-bound can be corrected. It so happens that a gentleman told me quite recently of an experience he had a number of years ago. A flock of choice White Leghorn chicks became not only crop-bound, but constipated. In those days chick feeds as now offered on the market were unknown, and he was feeding quite constantly dry cornmeal. An old drayman of the town, a shrewd, observing man, who was famous for his wealth of odds and ends of information, advised him to put one-half bran with the cornmeal. He did so and the trouble vanished. Bran is a good feed to form part of the ration, as it supplies what we may call roughage, preventing too great concentration of food elements.

Since I have stopped feeding my chicks at regular intervals, placing their rations (always dry) before them in hoppers or boxes, or else scattering it plentifully in deep litter so that they can help themselves at will, I have had very little trouble. The little fellows seem to understand their own needs better than we do, and seldom overeat. With grit at hand, sharp, not mere gravel, they thrive like weeds. When they are allowed to get hungry between their meals, they are far more apt to gorge themselves, and bring on varying troubles.

An experiment, tried by a physician, is interesting in this connection. He had some valuable fowls which became crop-bound, and, to all appearances, doomed. He reasoned that if he had a human patient in a condition at all like this he should as the first step see that the bowels were free. So he gave each bird an enema. The next morning, instead of being dead, they were ready for breakfast. Later, he took a number of premiums on one of the birds saved in this way.

If our friends will make the ration less rich and concentrated by the addition of bran, not feeding so much, but letting the chicks eat at will, placing sharp chick grit within their reach, and in some way making sure that the bowels are not confined, this trouble will probably disappear. The plan of hopper feeding is such a labor-saving method, besides being much better in its results, that if once tried we will never return to the old way.

POULTRY PRACTICE.

All those persons who are keeping poultry the returns from which are not what they had expected, we would respectively ask to critically investigate themselves and the management their flocks have received, and see if they cannot discover why chickens are not filling the egg basket as they ought. Inasmuch as there are so many mistakes made in the matter of providing suitable quarters for the fowls, examine the roosting quarters and see if they are not reeking in filth and vermin. The hen is too frequently required to roost in the most abominable places, and under such conditions cannot produce eggs.

A hen ought not to be required to roost in quarters into which the rays of the sun do not enter at sometime during the day that the sun shines. The hen herself loves the sunshine. Their quarters if not kept clean and the sun is shut out are sure to become unsanitary, and the hens will not thrive while being confined therein. Unthrifty hens do not lay. Then, at once, clean up the roosting room, and keep it clean—prepare some whitewash into which put some carbolinium—a pint to a gallon of the wash—and apply the same to the walls and ceiling of the room; paint the under side of perches, dropping boards and inside of nest boxes with pure carbolinium; dust the fowls thoroughly with buhack or insect powder until the faulty conditions referred to no longer exist. This proceeding will bring far greater results in restoring desirable conditions and getting the hens to laying than a wagon load of condiments and poultry medicines could possibly do.

Again, take notice if the hens are roosting in a draught, which might produce roup or colds in the flock; also, if the roosting room is well ventilated or not. Poor ventilation is likely to cause debility and disease under which conditions hens cannot lay. Remedy the same by substituting a muslin curtain and poultry netting in place of the boards on the south side of the building, and thus secure perfect sanitary conditions.

Don't feed the hens their grain feed in a trough, but provide a scratching room for them and keep the floor of same covered with no less than four to six inches of straw or like material, upon which scatter the grain daily, and require that they scratch for what they get. This will be natural exercise for the hens and develop their muscular tissues and keep them healthy and vigorous. Do not look for many eggs until this is done.

In addition, keep fresh water before them all the time, also milk if you have it. Of course, all know about the shells and grit, as well as the green stuff and the dust bath. Get the hens to laying and keep them laying. Breed right and maintain the fowls in good working condition. Let us know of your difficulties, and we will try to help you.—The Ranch.

The hen enjoys a dust bath these days as much as she does at any other time of the year, and a barrel full of dry dust is a good thing to keep in the poultry house. Provide a box for them to take their baths in and renew the dust in the box every three or four days.

Small Fruits and Vegetables

RUST-RESISTANT ASPARAGUS.

IN RECENT years asparagus culture has been seriously threatened by rust, which comes on after the beds have been well established and by gradually weakening the plants results in great loss to the grower and in the ultimate destruction of the plants. The disease has been particularly severe in the New England States, where asparagus is grown as a profitable industry. It is also severe in other sections, especially on the Pacific Coast, where some success has been secured in the matter of its prevention, probably owing largely to favorable climatic conditions. All efforts to control the disease in the East through the usual methods of spraying and similar treatments have met with indifferent success. It seemed desirable, therefore, that attempts should be made to secure types of asparagus which would be able to resist the rust. To this end collections of asparagus have been made from various sections of the world, and in co-operation with the Massachusetts Agricultural Experiment Station work has been inaugurated in the matter of securing rust-resistant types.

The particular matter to which we wish to call attention now is the result of hybridizing conducted by Mr. Oliver with a species of South African asparagus secured by Mr. David Fairchild, which seems to be rust-resistant. This South African species (asparagus virgatus) it is claimed has some other advantages over our types. The young growths are edible even when a foot high, and although the stalks are more slender than those of our cultivated types, this variety will probably prove a valuable addition to our stock of horticultural crops. Successful hybrids have been secured between the South African species and various varieties of our own asparagus. The ability of these plants to resist rust is yet to be determined, but the fact that we have secured the hybrids and that these hybrids, so far as appearances go, give every indication of possessing qualities of value, is worthy of note. Various crosses have also been made between different varieties of our own asparagus to determine the question of rust resistance.—Yearbook of Department of Agriculture, 1907.

BRUSSELS SPROUTS.

By repeated trials and the study of the habits of the Brussels sprouts this plant has grown in favor and proportion until it has become one of the leading factors in farming on Eastern Long Island. From the few quarts first raised and used it has grown in popularity until today millions of quarts are used and are shipped to all the large cities.

It can be grown in almost any climate where the cabbage and cauliflower thrive. The seed sells at 75 cents to $1 per ounce.

The method of culture is as follows:

Sow the seed in drills the same as for cabbage. When plants are large enough to transplant, pull them and plunge the roots in water, pack in crates and take to the field. If it is a very dry spell, use transplanting machines. If the weather is favorable, use dibbers, setting the plants eighteen inches in the row, with rows three feet apart. The land must be in a good state of cultivation, as sprouts are gross feeders. Use plenty of fertilizer. Thorough cultivation is one of the great secrets of success to this crop and will apply to any other crop.

After the crop has matured cut the plants off just above the ground with a corn hoe, haul them to some convenient place near the packing house and stack them in windrows about a rod wide and any desired length. Then begin the winter's work of picking. Sprouts are shipped in quart cups, the same as strawberries, thirty-two, forty-eight and sixty quart crates being used to ship them in. They are picked by the quart, pickers receiving 2 cents per quart. This is done by cutting the sprout from the stump with a small, sharp knife and all the outer leaves are trimmed off, leaving a miniature cabbage which is tender and delicious. The yield varies according to conditions. On highly cultivated land 4000 quarts are often gathered, and from that down to 2000 is considered a profitable yield.

REQUIREMENTS FOR RAISING EGGPLANT.

The eggplant, though capable of growing under conditions similar to those for the tomato, needs more time to produce fruit of suitable size, and, as it is a native of a warm climate, should have more heat from the first. The ground they are to occupy should be well manured, and, after a thorough pulverization, marked off in rows four feet apart. In these rows set the plants about two or two and one-half feet apart, and after they have begun to grow place around each a small quantity of poultry manure or other strong fertilizer. Cultivate or hoe often, so as to keep the ground loose and the weeds down.

As it takes about six months for the plants to bear fruit after the seeds have been sown, starting them during the month of March in hotbeds or hothouses is necessary. For this purpose the bed is watered, worked up and warmed, and the seed then sown in rows about three inches apart. Owing to the tenderness of the plant they want to start quickly, and this is best brought about by shallow planting and covering the rows with sand after the seeds are distributed. Preferably the soil in the bed—if a hotbed is used—should come up to within about five inches of the glass, and the bed be kept rather close, airing most when the sun shines and during mild weather. Unless it is quite warm the plants will do better to raise the upper, rather than the lower, end of the sash, and this not more than an inch or two. When the plants have got their second leaves they should be thinned to about two inches apart in the row. Unlike early tomatoes, it is not well to transplant them until they can go direct from the seed bed to the open ground.

It is important, of course, to get a good variety of egg plant, and one as nearly adaptable as possible to the locality in which it is to be grown.

In planting tomato, cabbage or cauliflower damage from cut worms can largely be avoided by planting with a collar of paper about the stem; this should extend 2 inches into the ground and 4 above. This can be supplemented by placing bran sweetened and poisoned with Paris green not too near the plants and by careful cultivation and killing the worm when found.

One grape grower of Lodi will ship 50 cars of table grapes this season.

LONG SERVICE

FARM WAGONS

THE wagon that breaks down and has to go to the repair shop every once in a while is not a good wagon to buy.

Such a wagon is a poor one because it is poorly constructed, and because it is made from poor and improperly seasoned material. It is dear at any price.

In the building of Weber and Columbus wagons there is always a rigid observance of these four indispensable requisites:

1. Proper wood materials,
2. Thorough seasoning,
3. Superior ironing,
4. The best of skilled workmanship.

These are the things which have built up the excellent reputation everywhere enjoyed by

Weber and Columbus Wagons.

The New Bettendorf Wagon has steel gears which make it a wagon for any climate, and practically unbreakable.

Strength and durability should be first considerations when you buy a wagon. The Weber, Columbus and New Bettendorf wagons can be relied upon for long, satisfactory service. They are built to haul heavy loads and to stand the rough usage to which farm wagons are always subjected.

These wagons are in the front rank of high-grade wagons.

With all the strength and durability of these wagons, they are not made excessively heavy. They are noted for their light running qualities.

International local agents will be glad to show you these superior wagons and furnish catalogs with all desired information. Call and take the matter up with them or write to nearest branch house.

Peckham Says

Increase Your Income $2,000 a Year

I want every man or woman who is interested in his or her future to look into our Corcoran land proposition—the land that you easily make $2000 a year on.

I want you to see this land for yourself; you can go with the next party I take to look at the property, or I will gladly furnish you with the names of men who have gone, and you can ask them what conditions they found.

There are many features of this land that make it safe and profitable which I haven't space to touch upon, but any one living in Los Angeles who is interested should call at my office for details; those living outside of the city should send for Profitable Realty, which gives full details.

George C. Peckham & Company

203-4-5-6 Union Trust Bldg., Corner Fourth and Spring Sts.
Phones: Main 3221, F5392.

The prime object of cultivation is to render the soil loose and light.

Warranted to give satisfaction.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

Fanning Mills

"The California"

This is one of the most powerful and complete cleaners in the market, and is known as a double blast fan mill. The first blast operates as the grain passes in showers through the sieves, and in this operation the chaff and light stuff is removed. The second blast operates as the grain passes off the last screen in a thin stream and at this time the heavier particles are removed. These mills are rigged to clean beans.

We are also agents for the

Western Fanning Mill

This machine is not only a cleaner but likewise will acomplish what no other machine on the market will do. Separates wheat, oats and rye, clover and timothy and makes them marketable in their class. Separates cheat and cockle from wheat. Separates wild oats from wheat, barley and large tame oat. Separates barley from wheat, and rye from wheat. Equipment is five screens and sieves, one wheat zinc hurdle, a chess-board, tail-board and spout suitable for all requirements of a farmer. Will clean and grade beans. Alfalfa and bean screens are extra.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Farming by the Square Inch.

Will you please give in the query columns of your valuable paper information regarding farming by the square inch, which I saw in the issue of August 6? Is there a book or magazine published describing the Frenchman's method of intensive farming?—T. H., San Diego.

We do not know that there is any book describing the method referred to in the article. It is simply intensive farming carried to the extreme and we do not doubt any book on commercial gardening would aid in getting information regarding this matter.

Olive Culture.

I should like a book pertaining to olive culture. Can you give me name of such book and where it can be purchased?—G.W.B., El Toro.

The State Board of Horticulture at one time issued "California Olive Industry," which if still in print may be had by writing to J. W. Jeffrey, State Horticultural Commissioner, Sacramento. The State Experiment Station also issued a bulletin on olives, pickling process and a good many notes which may be had by addressing Prof. E. J. Wickson, Director State Experiment Station, Berkeley, California, provided it is still in print. We do not think that any book touching on California conditions in olive culture is for sale.

Nematodes.

I enclose sample of diseased tomato roots. They become swollen and soon rot away. Soil sandy, drainage good, and plants have had best of care. Have planted squash where tomatoes were and squash seem to be affected the same way. Will disease attack all roots?—M.S. St. C., Lordsburg.

This query was referred to Prof. Ralph E. Smith of the Southern California Pathological Institute and he writes: "The samples of tomato roots recently received are affected with nematode worms which cause swellings or galls on the roots and serious injury to the plants. These worms affect a great variety of plants and it is not safe to plant anything in affected ground with assurance of its being immune.

The best method of control is to let the ground lie bare and dry throughout the summer for at least one year.

Keeping Beans from Weevil.

Further answering a query which appeared in a recent Cultivator, Mr. C. F. Lee of Pasadena sends in the following which he gave to the Cultivator some years ago. It is no doubt excellent for keeping small quantities of seed. Mr. Lee's formula is as follows:

"Place seed beans in glass fruit jars with small piece of fabric saturated with carbolic acid. Put on rubber and screw down lid. We have used two-year-old seed this season and they grow well." Mr. Lee adds that he has grown seed preserved in this way and he has never had a failure.

Dropping Grapefruit.

What is cause and remedy of dropping grapefruit? Tree in very fair condition, apparently, though very young and sets full of fruit. When about the size of marbles nearly every one falls off. Has some scale.—H. G. H.

It is hard to determine why your grapefruit drops, but it may be the fault of your particular tree. We had several seedlings at the Pomona Station and some of them always dropped most of their fruit while others produced well. If your tree is budded fruit it must be due to some local condition. Try a liberal supply of stable manure on it.—J. W. M.

Dodder.

There is a small clinging weed or vine, apparently a parasite, infesting my alfalfa. Some call it the love-vine What is it and what is the cure?—S. D., Compton.

This is nothing more nor less than the common dodder, referred to often in the columns of the Cultivator. It is a perplexing pest and about the only remedy after it has once secured a foothold is to burn by placing straw or other combustible over the entire spot infested. This destroys some of the alfalfa but seems to be the only remedy. The best remedy, however, is the preventive. That is, in buying alfalfa seed be sure and get clean seed, because ordinarily the infestation comes from the seed when the crop is first planted. Where the irrigation supply comes from the mountains, it is barely possible that the pest comes in the water, as the dodder more or less infests the native growth of the mountain sides.

Seed Inoculation.

Is there any value in the inoculation of seed with a culture of bacteria for nitrogen and cover crops?—S. E., Redlands.

The inoculation of seed has been disappointing to some, but mainly, doubtless, through not understanding the method of handling. Some maintain that the best method of inoculation is to obtain soil from some place where the particular crop to be used for a cover crop has been grown successfully. The soil may be scattered in the orchard as the seed is sown; or it may be washed and the water used to inoculate the seed. Also, the dry form of the inoculating material may be had by addressing the Johnson & Musser Seed Company. They keep it in stock and have found that where carefully handled it does great good.

Jerusalem Cherry Trees.

Would like to ask a question or two through the Cultivator. I have a row of Jerusalem cherry trees. They did well until they were about three years old; then the leaves began to turn yellow around the edges. I examined the roots and found them one mass of small lumps, with a large growth clear around the base of the tree, just below the surface. Could you tell me the cause of this and the cure, if any?—P. J. G., San Diego.

Your cherry trees have root knot or nematode worms. The former produces a wart-like growth on the roots, mainly on the large roots, while the latter produces a bead-like effect on the small roots. There is perhaps no remedy for either that will save your trees or make them profitable to keep. Nematode worms live in the soil and must be starved out to be gotten rid of. Cutting out root knots and washing the wounds with blue stone and water will give relief in mild cases.—J. W. M.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Red Scale.

Will you please tell me through the Cultivator how to treat red scale on orange trees? If fumigation with hydrocyanic gas is to be used, how shall I use it?—H. J. M., Selma.

To give complete directions on this point would require much more space than is at command of this department. But there is given in this week's paper a couple of pages of information regarding Mr. Woglum's latest investigations. You will see the general form of a tent is octagonal. In making a tent the strips all run one way, and to secure uniformity of dosage it is well to mark it as indicated on page 172. After determining the strength or amount of gas for your particular sized tree, the gas is manufactured by mixing in a vessel one part of cyanide of potassium, one part sulphuric acid, three parts water. These are not mixed together until the tent is placed and everything all ready. The gas must not be breathed. In saying one part cyanide, etc., we mean that if the dose for instance is one avoirdupois ounce of cyanide, then use one fluid ounce of acid, and three fluid ounces of water. The tent, after being placed over the tree is allowed to remain for an hour. All work must be done at night to prevent burning of the trees caused by decomposition of the gas by light. The dosage as given in the table on first page of this issue will be abundantly strong for your red scale and will probably burn tender growth on tree somewhat.

Bleached Walnut Seed.

Does bleaching impair the vitality of English walnuts or would you advise getting walnuts that have not been bleached, same to be used for planting?—J. M. W., Hutto, Tex.

By all means get unbleached nuts for planting purposes. Further, get them from some reputable grower who will guarantee them to be from vigorous, strong growing, continual bearing trees. There is great difference in the ordinary seedling walnut and only the best should be selected. This is assuming that you wish to grow the seedling tree. The best growers nowadays are generally planting grafted trees which may be on common black walnut root. This will produce for you a vastly more satisfactory orchard.

Planting Potatoes.

I would like to ask if it is advisable to plant a crop of potatoes at this time to hide an unsightly garden spot surrounding a new house.—E. C. G., Los Angeles.

To secure a fall crop, potatoes should be planted at once, and even a little earlier would have been better. However, if given a good season you will probably secure fair returns from planting at this time.

Farm Names

HAVE you named the home yet? If you have, let the Cultivator help to establish the name and fix it in the minds of your neighbors and others in this state.

If you haven't get busy and think it over. It will attach a new value to your old home. Not only in your own mind from a sentimental standpoint, but it will appear in a new light to your neighbors.

It is not necessary that it be a grand and high sounding name, but make it typical if possible. Does a brook run through it lined with trees? Then name it "Brookhurst." Hurst means a wood or grove and is capable of many combinations.

Is your little field so small as to be "hardly worth a name." Just a little "home croft." Then work in croft in combination with other words. Croft means a small farm or field adjoining the home.

Increase our list by sending in new home names. Northern California takes the honors this week. Southern California hasn't a single name in and the central part of the state has allowed the northern part to present the greatest number.

The names sent in this week are:

Rancho Santo Antonio, owner, A. J. A. Freitas, Hanford, Kings county. Mr. Freitas writes that his place is of 160 acres, is a mile west and seven south of Hanford. He bought the place unimproved and is now building house, farm buildings and other improvements.

Lindoford, owners, Mr. and Mrs. N. Woodford, Chico, Butte county. The owners write that Lindoford is situated two miles north of Chico, Cal., on the Lindo Channel, which is bordered with trees and fringed with wild grape vines.

"We have orange, lemon, pomelo, fig, persimmon, umbrella, pomegranate, peach, plum, pear, apple, prune, walnut, oak and pistachio trees; also garden and small fruits. There are twenty-two acres of land and, besides, good tools and machinery. We have some conveniences in the house, which is eight-room, besides pantry, bath and closets, such as power washer, bread worker and the handiest kitchen in California."

The Nutshell, owner Mrs. Mary A. Powell, Elk Grove, Sacramento county. "The Nutshell" is announced on a beautiful embossed letterhead on high grade linen paper. It doesn't smack of the old-time or typical backwoods farm life, but shows that the up-to-date catchy things of town life may be transplanted to the farm. Mrs. Powell writes:

"I have been very much interested in your articles on 'Naming the Ranch,' and will say that we had scarcely unloaded the car that brought our household goods from the East before we began thinking of a suitable name for this beautiful little forty-acre ranch.

"While we have nearly every variety of fruit on the place, we expect to make a specialty of English walnuts. We already have nut trees on the place that former owners planted twenty-five years ago, hence the name, 'The Nutshell.'

"We find the California Cultivator very interesting and helpful in our work in our new home. May it live long and prosper."

Indian Hillock, owner J. T. Law, Loomis, Placer county. Mr. Law also has printed letterheads and fine linen stock, but has not yet placed the ranch name as a part of the heading. He writes:

"I call it Indian Hillock because there are on the land several rocks containing numerous holes 12 or 18 inches deep by six or ten inches wide, evidently worn centuries ago in the granite by Indians grinding or pounding their roots, corn, etc. I am sure it would greatly interest travelers passing along our roads if every place bore its name and the name of the occupant. A coat of whitewash on the fence posts also brightens up a district wonderfully and costs next to nothing. Farmers and others should all have their names on their wagons, carts, etc., instead of the maker's names."

At the entrance of Mr. Law's place is the ranch name painted in black on a white ground.

"Alfadena," owned by L. E. Dahling, Yuba City, Sutter county.

"Our home place comtains one hundred and sixty acres and we expect to have the greater part of it in alfalfa, consequently we have named it "Alfadena.'"

The Ornamental Garden

BACK YARD GARDENS.

There are few home makers who have not at one period or another come in contact with that most difficult of problems—the unsightly back yard. With its gaping fence, its vigorous growth of weeds and most frequently its share of rubbish and litter, it seems to defy any attempt which might be made at its improvement. More than one discouraged matron has abandoned the back yard to its fate, leaving it the one eyesore around an otherwise attractive home. Yet, there is no reason why this spot should not be made pleasing and even beautiful, if the secret of so doing be possessed by the owner.

The first step needs no directions, for it necessarily consists of clearing away the rubbish and litter which have accumulated through the years of neglect, and which would prove effective obstacles in the way of plants and flowers. When this is done, however, and the space presents a tidy appearance once more, the real difficulty presents itself. The yard is clean; but it has a bare, uninviting aspect, which ill accords with the velvety lawn, with its gay flowers, which fronts the house. Vegetation of some kind must take the place of the luxuriant crop of weeds recently removed in order to really accomplish the reclaiming of the back yard. Upon the space, as well as upon the amount of sunlight that it gets, the choice of flowers depends, although there is one rule which might be invariably used to govern the selection. Plant only those flowers which are hardy, profuse bloomers and easily cared for, as lack of time, perhaps, more than anything else, is responsible for the condition of the back yard. A very pretty idea, and one which cannot fail to give satisfaction to the owner, is to make of the back yard an old-fashioned garden, where the flowers popular a century ago may bloom. Petunias, marigolds, nasturtiums and a number of others will adapt themselves admirably to the back yard garden. Not only will they bloom in the shade, but from early summer until the frosts they will flower continuously, keeping the garden bright. Then, too, they fit themselves to the space, showing to equal advantage in the most diminutive plat. For a small space, bulbs are not to be particularly recommended, unless, of course, time is not an object to the maker, as while they promise early bloom they last but a short time and require moving, if other flowers are to take their place.

If space permits, a tiny walk, intersecting the garden and bordered on either side by sweet alyssum, or with any of the low, prolific bloomers which adapt themselves to this purpose, should by all means be included in the garden plan. Besides the alyssum, a row of taller plants with blossoms of a contrasting hue render both the border and themselves more effective.

There is no reason why the back door should be less attractive than the front entrance. There are many ways in which its appearance might be improved, but none more effective than the tiny trellis which shades and beautifies the doorway. Over it may be trained one or more of the numerous varieties of vines which are particularly adapted to trellises. Clematis Paniculata, a beautiful and well-known one, possesses decorative value not only for its glossy, dark green foliage but for its fragrant white blossoms. The Mexican or Mandarin vine, known by names as numerous as the colors of Joseph's coat, is rivaled by the humble morning glory, scarlet runner and climbing nasturtium vines in the back yard garden. Harmony and simplicity are the combination to be sought after in the garden. And the last-named vines harmonize perfectly with the annuals which are most suited to the back-yard garden.

Trained against the fence or the side of the house, the vines make a pretty background to the bit of gay coloring of the flowers.—Farm and Field Life.

BIRD HOUSES.

The right kind of bird house is made to attract some particular bird, to keep out cats and English sparrows, and it is as simple and inconspicuous as possible. Don't set a Swiss chalet on top of a bare pole where everyone can admire your handicraft and the cats can eat the bluebirds. Make simple boxes like the one described here. Use weather-beaten boards and don't paint them; or, better still, use hollow logs that will match the trees you put them in.

The first thing to think of is a cat-foiler. A sure and easy way to keep cats down is to put a piece of tin around the pole, trunk or limb that carries the bird house so that it will stand out horizontally and the cat cannot reach around it and climb above the obstruction. So, first consider where you are going to put the bird house and how you propose to fool the cats.

The next most important thing is to find out how big to make the entrance hole to let in the birds you want and keep out their enemies.

For wrens make a hole the size of a 25-cent piece. Ridiculous as it sounds, you can make an excellent wren house out of a quart tomato can, painting it afterward some neutral color to make it inconspicuous. Make a circular hole one-half inch in diameter; clip the edges and bend them with a pair of pinchers to make a suitable smooth doorway. Cut the hole close to the rim of one end. Nail the other end to a piece of board so that the nesting bird may sit lengthwise of the house and have a round doorway above her head. Punch a hole in the bottom to let out water. Nail the supporting board wherever you wish and see that no perch for an intruder is within reach of it.

For chickadees make the hole 1¼ inches in diameter. A box 12x5x4 inches (inside measurement) is ample for chickadees or wrens. For safety mount it vertically so that the nest will be at the bottom and the doorway at the top.

To prevent rain from getting into your birdhouse, you can make a tin roof, but if you do so paint it a neutral color. Or make a rather high-pitched roof of young pine or birch bark or old leather. If you want to make a box out of shingles and have only new ones, tack bark on the outside to make them inconspicuous. Beautiful houses can be made of birch and chesnut bark, but you would better wait until spring to make these, because bark does not strip well in winter.—Marion Llewellyn.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

MACHINERY.

WE CARRY A GENERAL LINE OF MAchinery, gas engines, air compressors, boilers, engines and pumps. 40 car loads of screw pipe and casing can be cut to lengths, also all kinds and sizes of fittings. Several hundred iron fence posts. R. KELLY MACHINERY CO., corner of Mission road and Macy street, Los Angeles, Cal.

FOR SALE—SECONDHAND PIPE AND oil well casing, all sizes, any amount; boilers and engines; gas and distillate engines; pumps, etc. Get our prices before you buy. A. CANNADY & CO., 1029 N. Alameda St., Los Angeles, Cal.

FOR SALE—AIR COMPRESSORS BELTED and steam driven also steam pumps and other machinery. See us before buying. We can save you money. Baille & Brandt Co., 943 N. Main St., Los Angeles, Cal.

FOR SALE—6-H.P. GASOLINE ENGINE and centrifugal pump never been used at a snap. N. W. cor MAIN & BRUNO STS., Los Angeles, Cal.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FOR SALE—ALTERNATING AND DIRECT current motors, from 5-H.P. up. We also rent motors. Baille & Brandt Co., 943 N. MAIN St., Los Angeles, Cal.

FARM LANDS FOR SALE.

RANCH FOR SALE—105 ACRES AT $40 AN acre; 85 acres in cultivation; nearly all of remainder can easily be put in cultivation; 45 acres level land; 800 full bearing apricot trees; 5-room dwelling; good large barn; fruit drying plant; 5 miles north west from Moorpark; half mile of school; land suited to beans, hay and corn. For further information apply to WM. ROBINSON, Moorpark, Ventura county, California.

FOR SALE—1 TO 10-ACRE TRACTS ON CAR line, between Riverside and new cement works; good for chicken ranches, alfalfa or gardening; will sell on easy terms; plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

ORCHARD HOMES FOR SALE—FIVE acres and upwards; fine citrus and deciduous fruit lands on easy instalments and low interest. Write us today. Wyatt & Wilson, WINTERS, Cal.

EGGS FOR HATCHING.

EGGS FROM MY PRIZE WINNING BARred Rocks; won all firsts, all seconds but one, and all specials on Barred Rocks at L. A. C. P. A. Show, 1907. Eggs from best pens, $3 per 15; $12.50 per 100. Stock for sale. CHAS. E. SMITH, Gardena, Cal. San Pedro Interurban car to Smith's Crossing.

POULTRY

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. Regular 10c can free, postage paid, for 10 addresses of poultry keepers. WEST COAST MILL, 705 Griffin Ave., Los Angeles Cal.

PARTRIDGE WYANDOTTES—C. ANdrews, 823 W. Franklin Ave., Hollywood, Cal.—1st cock, hen, cockerel and pullet; 3 cups, Poultry Breeders' Show, 1908.

WANTED—MALE HELP.

NINETEEN JOBS GOING AT PRESENT—Electricity, plumbing, bricklaying taught in few months; tuition back after two months; advanced students paid wages. Free catalogue. UNION TRADE SCHOOL & CONTRACTING CO., 120-126 E 9th St., Los Angeles, Cal.

DOGS.

SABLE AND WHITE COLLIE PUPPIES—Sires, Brandane Wishaw Squire and Glen Fana Bounder, litter brother to Aufield Model. Dams, Ormskirk Gloriana and Presidio Nellie. $10 to $25; 2 to 8 months. GLENALPINE KENNELS, Grandville, Cal.

FOR SALE—COCKER SPANIEL PUPS, 8 weeks old; blacks, $10 each. MINNEWAWA VINEYARD, Fresno, Cal.

TREES.

FOR SALE—1,500 EUREKA LEMON TREES and 1,000 Washington navel orange trees, true to name. Also street and ornamental trees. Clean, healthy stock only offered. GEO. B. WARNER, SANTA ANA, CAL.

SEED.

FOR SALE—EUCALYPTUS RUDIS SEED, fresh, by pound or ounce. MINNEWAWA VINEYARD, Fresno, Cal.

PARTNER WANTED.

WANTED—A PARTY TO TAKE AN INterest in my seed and poultry supply business, who has a good nursery and can furnish plenty of nursery stock. Have a fine store; grand location and splendid opportunity. Address or call, S. H. CHURCH, 636 S. Main St., Los Angeles.

NURSERY FOR SALE.

OLD ESTABLISHED NURSERY BUSINESS for sale. Good stock. Good location. Good reasons for selling. Address THE AUBURN NURSERIES, East Auburn, Cal.

Your Eastern Trip

SOUTHERN PACIFIC

May be arranged so that you may travel by way of

New Orleans and the Sunset Route

San Francisco and the Ogden Route

Portland and the Shasta Route

Enjoying the balmy air of the South or the cool and bracing air of the North.

Personally conducted excursions every day from Los Angeles via all routes without change to principal eastern points.

Southern Pacific

Household Department

PA AS A CARPENTER.

Father took his coat off—said,
"I'll do that job today.
We need a chicken coop, you bet;
Our hens all get away."

He found the hammer and the nails
And then he got the saw,
And went to work while all the tads
Looked on in silent awe.

Somehow, the boards seemed rather tough
And fate was most unkind;
While father puffed and puffed and puffed
His trousers split behind.

At last he got some short lengths cut
And while he mopped his face
He studied out the proper way
To put those boards in place.

He nailed a strip across a strip.
Then he made a slight miscue;
The hammer came down on his thumb
And mashed it black and blue.

Then father used some language that
Was never heard before,
And mother took the babies inside
And softly closed the door.
—Birmingham Age-Herald.

HIS PRIZE.

THE broken window of the old garret was stuffed with rags and odd pieces of clothing, and the cutting December wind whistled shrilly through them, causing the fine particles of snow to form little eddies in the air and on the floor.

In one corner of the room, as far as possible from the window, sat a tall, lank figure, his glowing pipe making quite as much light as the small fire that burned in an old stove at his side.

Dalton knew that the last chance of a long and bitter fight was before him. He had tried time and again with unfailing energy to succeed, but the rebuffs and disappointments had piled up as fast as had the rejected manuscripts on his table.

With one last effort he had written the story of his ups and downs, and he incidentally wove into it the story of his love affairs—college dreams they seemed to him.

"This story must go," he muttered, "it's got to." With a sigh he laid down the papers. There was a sound of hurried footsteps in the hall, and the door burst open, admitting a ruddy-faced young man in a summer suit and with no overcoat.

"Hello, Dalton," he cried. "What's doing to-day?"

"Oh, nothing much," answered Dalton.

"What's this?" asked Joe Lamier, picking up the story from Dalton's lap.

"That," said he, "is my last chance."

"Tell you what you do, let me put it in that prize story contest the Daily—— is having. It's $500 for you if it wins," was the friendly suggestion. "Sister's got one here that I'm going to take over." And he drew some papers from his pocket.

Dalton read the story through carefully, then handed it back, exclaiming:

"That's got mine beat. Is there a second prize?"

"Sure—good chance to land that. There's $200 in it."

"Well, take it along then, and tell your sister she's—well, tell her she's a dandy at the business. Will you, Lamier?"

Two weeks later, after a good, big, square, filling meal at the Salvation Army house, Dalton sat in his little room and read the list of prize winners. His name was missing from the solid list that his eye fell upon, but as he glanced at the head of the column he could hear his own heart beat. There, in large black type, were the words: "Mr. Luke Dalton First Prize.'

A letter addressed to him was in the mail box. He thrust it into his pocket as he walked over to the Lamier flat. Grace Lamier, with laughing eyes that sparkled delightedly, opened the door for him. "You didn't get the prize?" he questioned, still unbelieving.

"No," she smiled.

"Why?" he asked. "Why? Your story was much better than mine."

"Was it?" she replied, as they were seated. "Maybe the judges didn't think so."

"I'll bet they did if they saw—" he paused, as a thought came to his mind, then he blurted out: "You didn't send it, did you? I can see by your face you didn't."

"No, I thought better of it, besides, it really wasn't any good." Her twinkling blue eyes seemed to confuse him.

"Why didn't you send it?" he continued.

"Oh, I—I—" she broke off hastily as he came closer to her chair.

"Because you wanted me to win. Is that it?" He was laughing now.

"Maybe," she replied. The pressure of her hand in his left no doubt, and what followed left her hair in a state of disorder that caused them both to laugh.

He pulled the letter out of his pocket, and a green slip of paper fell to the floor. The girl picked it up, looked at the $500 writen on it, but the man was reading the letter, with a bewildered look on his face.

"Grace," he cried, "I guess we won't have to wait very long for those wedding bells; just read this. He handed her the letter.

"Report at $25 a week," she read. "Luke, isn't it just dandy?"

"I'll accept it upon one condition," replied Luke, trying to look seriously at the merry, flushed face of the girl.

"What is it now, Mr. Author?" she asked.

"That you report at the minister's with me at once," he cried, as he folded her in his arms.—Universal Magazine.

A FEW BUSINESS B's.

Be personally interested.
Be progressively alive.
Be physically active.
Be prodigious in energy.
Be pushing in business.
Be punctual in appointments.
Be painstaking with customers.
Be pleasant to all.
Be partial to none.
Be plucky at all times.
Be peaceably inclined.
Be positive for principle.
Be productive for good.

FEARFULLY AND WONDERFULLY MADE.

A school teacher, after spending forty-five strenuous minutes explaining the mysteries of physiology to the primary class, sounded their intelligent attention by asking the definition of vetebrae. A small and anxious boy on the back seat arose and delivered the following:

"The vertebrae is a long, wavy bone. My head sits on one end of it and I sit on the other.

Not the lowest-priced; but the lowest-cost.

Genasco Ready Roofing

Saves repair-money and time and trouble. Made of Trinidad Lake Asphalt, the greatest weatherproofer in existence.

Gives you longer roof-protection than any other ready roofing at any price.

..... $2.50

Cultivator Publishing Company

COOKING GREEN CORN.

There is no immature product of the garden to equal in food value and in distinctive excellence the rich succulence of a good variety of sweet corn, such as the Country Gentleman. Additional importance is given by the long season for which it is available. The earliest planting may be ready for use in July; the latest is only cut short by the nipping frost of autumn's first serious chill. With a favorable season green corn freshly picked may be had for full three months, a fourth of the entire year. For the rest, we must content ourselves with canned or dried corn.

The simplest ways of cooking green corn give so good a result that elaboration seems unnecessary. Yet there is wide room for variations and many excellent combinations are easily made. Cooked with beans we have the flesh-forming elements of fat and lean meats. Served on the ear the operation of eating from the cob is somewhat difficult to perform with ease and grace, but it can be managed with sufficient skill, and to many persons corn on the cob has a relish quite beyond any other mode of serving. A common fault in cooking corn on the ear is too long boiling. So much depends on the condition of the corn that a time rule is of little value. But if the kernels are still very soft, in that state which gives, to my taste, the best of its sweetness and richness, ten minutes' cooking is sufficient. Plunge in an ample quantity of boiling, salted water; cover and note from the time when the bubbles begin to rise again. Seven minutes may be sufficient. When the milky juice is once "set" and the raw flavor gone, longer boiling tends to harden; it has no further good effect.

The tender ears may be broiled over coals in a wire gridiron, care being taken to avoid scorching, and served very hot as roast corn. Eaten with salt and a liberal allowance of sweet butter, the flavor is something to be remembered. "Roast corn! I haven't seen it since I was a boy!" was the exclamation of an elderly man, familiar with the world's best in matters of the table; it was very gratifying to the hostess to see how his appetite responded to the call of the long neglected dish.

Corn cut from the ear and roasted or really baked in a very hot oven in a buttered pan is another mode worth trying. Salt lightly and shake the pan often to stir thoroughly.

Lima beans are best for the familiar succotash, supposed to be the invention of our Indian forerunners. But other beans may be substituted on occasion, taking care to remember that the beans require longer boiling and must, therefore, be put over first and the corn added later. In cutting the corn from the cob a shallow cut is always best, pressing out the remaining pulp with the back of the knife, so as to leave the husk or skin of the kernels mostly upon the cob. By first scoring each row of kernels lengthwise the milk and pulp may be pressed out in the best condition for those combinations with milk and eggs which have various names, such as corn oysters, corn custard, etc Some of these forms of serving corn are among the most delicate and palatable of vegetable concoctions, and at the same time give a result very high in nutritive value.

The uses of green corn are so many and various that it is easy to find a place for it on the table for every meal if one chooses. It makes a delicious and heartening soup or rich broth with hardly any other material except a little milk or sweet cream. For a hot supper dish one may have plain corn, boiled or roasted or browned (cut from the ear) in a hot frying pan, with a little salt and a very little hot water added as it browns, to make a rich gravy. In salad form, use cold corn cut from the ear and mixed with diced apple. Serve on lettuce leaves with a French dressing or mayonnaise. A green corn omelet is one of the best of summer breakfast dishes. Allow for it an ear of corn, not too large, to each egg. Score and scrape out the pulp, mix with the eggs, well-beaten, white and yolk together, season with salt and pepper, and add a tablespoonful of cream or rich milk for each egg. Cook, fold and turn out as usual. Fritters, corn pudding and corn pancakes are other variations.

The Boston baked beans will have a new and very rich quality if about half an hour before serving an equal quantity of sweet corn, cut from the cob, is thoroughly stirred into the pot. Return to the oven and serve as usual. Corn pudding is frequently served with fried chicken and is equally good with roast lamb or lamb chops. It should be of a rich custard-like consistency and the proportions may vary considerably as more or less eggs are used. To a quart of milk allow two, four or six eggs, and more or less corn accordingly. Score and scrape off the corn and beat the whites of the eggs separately and thicken with the corn to make a good soft batter.

Other uses are easily suggested. Various combinations, for example: summer squash pulped and strained combines pleasantly with corn, either in soup, or in "oysters" or little patties to be baked. It is a pleasure to use one's own ingenuity in producing a new dish now and then. No flavor is more appreciated than that of individuality on the home table.—Country Gentleman.

NEEDED STRENGTH.

"I have seen many fantastic and humorous advertisements in newspapers during my somewhat lengthy career," once said Colonel Henry Watterson, in an address to a convention of journalists, "but quite the most interesting and oddest of these was an ad. that I chanced upon in London. It was printed in the staid old Times, and as I remember it, ran something like this:

"'A young gentleman who is on the point of getting married is most desirous of meeting a man of experience who will take the responsibility of dissuading him from this dangerous step.'"—Harper's Weekly.

BOOKSELLER'S BRIGHT THOUGHT.

In a London bookseller's catalogue the following entries appeared:

Patti, Adelina Life of
" oyster, how to make.

This case is fully paralleled in the latest volume of the "English Reference Catalogue," a very important bibliographical publication, where the following entries appear:

Lead, Copper.
—— Kindly Light (Newman).

WHY NOT?

Mater—"I wonder how George got hay fever?"

Pater—"He was pretty thick with that grass widow, last summer, you remember."

Hay.

Somers & Co. say:

Receipts of hay for the past week amounted to 3890 tons, an amount about equal to that which arrived last week. Conditions remain practically the same here so we can report absolutely no change in prices. But little interest is shown in any hay on the market with the possible exception of an occasional car of fancy wheat hay, which quality is seen but very little here now owing to the fact that people who purchase this quality of hay cannot bring it in at present and realize and profit on their investment and they are, therefore, holding it in the country with the idea of a better demand later on. Whether this will come or not has yet to be decided for trade still continues dull and we are all the time getting reports to the effect that many consumers who have any amount of storage room have sufficient old hay on hand to last them some little time. One or two of the larger consumers are filling their barns, but this has had no noticeable effect on the market.

UNCERTAINTY OF FUMIGATION REMOVED.

Continued from page 171.

ground on one side and the figure 15 on the other side, then it is 30 feet over the tree. If the men have been careless in throwing the tent and the center of the tent is not over the center of the tree still it registers accurately, for if one side registers 10 feet and the other 20 feet still it is the thirty feet. That is, the sum of the figures is the distance over. That is one dimension.

The other dimension is the tree circumference. This is secured by pacing about the tree, and one with ordinary care can do that with sufficient accuracy.

The fumigator now has the two dimensions, the "circumference" and the "over." To make these of value, Mr. Woglum has prepared a chart figured on the basis of one ounce of cyanide being sufficient for 100 cubic feet of space under the tent. This is a strong dose, found to be sufficient. The fumigator takes this chart; he follows down the left hand column and finds his distance over; say, for instance, the tree is 30 feet over and 30 feet in circumference, then along the top he finds that figure. At the intersection or crossing of these lines is the exact dose for that tree.

The wayfaring man need not err therein and the common laborer has no excuse for not securing good results under this improved plan. It should mean vastly better results from the fumigation process.

FUMIGATION INVESTIGATIONS.

Continued from page 173.

definite dimensions as herein specified, was worked out independently for that particular tree. A chart was then made and these different dosages for trees of different dimensions placed therein. The result is this chart, a glance at which will show that there is no abrupt break from one end to the other but a gradual increase in the dosage as the tree becomes larger.

This dosage is about the equivalent of what is known among many fumigators as a double dosage; that is, about twice the dosage strength ordinarily employed against the black scale. The schedule was prepared for the purple scale but can be used for any other scale. This schedule is not one of eradication for the purple scale and was not prepared with any such idea in mind. As stated previously in this paper it was prepared for use against the purple scale in the Whittier section during the latter part of July, at a time when the young fruit in some orchards was about the size of a walnut. It was made with a dosage of as great strength as the fruit would stand at that time without injury. It is possible that a stronger dosage could be used at this date wtihout ill effects. I do not believe that it is advisable to use a dosage of less strength against the purple scale.

This schedule is uniform throughout as to dosage-strength. It thus easily allows an increase or decrease in strength if desired. If a person does not consider this dosage heavy enough he can increase it very readily by any amount he wishes, by simply increasing eacn number or dosage in equal proportions and vice versa.

Total Available Gas.

One more consideration. It is the use of water in fumigation. Equal parts of acid and cyanide are used by most fumigators. The proportion of water used, however, varies all the way from 2 to 8 parts. Believing that there must be some difference in the amount of gas available where different proportions of water were used, a careful experiment was outlined, which was performed, and the analysis of the residue made by the Bureau of Chemistry at Washington. The result of this experiment goes to prove that the use of more than 3 parts of water to one of acid results in a net loss of gas through absorbtion by the water so that where 8 parts water are used twice the quantity of cyanide and acid is necessary. This makes a needless waste.

Many fumigators in their work frequently give trees severely infested with scale a heavier dosage than other trees less severely infested. Almost as frequently, also, the proportion of water is increased on these trees receiving the heavier dosage, thus unconsciously preventing the object which they sought to attain.

Pioneer Rubber Sanded Roofing

The Roof that "proves," sun-proof and rain-proof, needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

Some Hardy Varieties of Eucalypts

Leonard Coates of Morganhill Writes Entertainingly of Some of the Lesser Known of These Useful Trees

THERE are several species of very hardy eucalypts which are unknown in California, unless, possibly, in the collection of some amateur. There are also methods which may be employed in the propagation and growing of the young plants, which will tend greatly to harden them; not, of course, changing their characteristics, but rendering them less susceptible to climatic extremes. And these extremes may be said to be 15 degrees and 125 degrees, in spite of the equability of the California climate of which we hear so much but experience so little.

Dr. Horace Bushnell, 50 years ago, wrote of the "incredible anomalies" of the California climate. "It cannot be said of California, as of New England or of the Middle states, that it has a climate. On the contrary, it has a great multitude of them, curiously pitched together, at short distances, one from another, defying, too, not seldom, our most accepted notions of the effects of latitude and altitude, and the defences of mountain ranges."

Fortunately, some of the most valuable species will stand all these "climates," and those that do not may be planted near the coast for a length of 600 or 700 miles.

Some of the hardiest of the eucalytpus family are described by Chief Forester Matthews, of the government of New Zealand, in a recently published book on "Tree Culture" in that country. All of them we have now growing in our nurseries and we shall be distributing them at various elevations in the Sierra foothills as well as in the Coast range.

Eucalyptus coccifera (mountain peppermint gum.) This species is frequent up to 4000 feet in Tasmania. A specimen has stood 23 degrees of frost in England without injury, and is now 78 feet in height. It has a tendency to a tall, central stem, frequently rising to 150 feet. The timber is heavy, reddish and extremely durable. It grows naturally amongst rocks and on poor gravelly soils at fairly high altitudes.

E. urnigera (urn-bearing gum.) The foliage is denser than coccifera, otherwise very similar, though it can be readily identified by its capsules, or seed cups, which are shaped like a Grecian urn. It is found only in the cool, elevated regions of Tasmania.

E. Muellerii (known in Tasmania as mountain red gum). Not to be counfounded with E. Muelleriana, being but recently discovered, and growing only in the alpine regions of Tasmania, where it is said to attain a height of 200 feet, and often 100 feet without a single branch. The wood is very hard and heavy, though it has not been known long enough for proof of its durability to be established. It has withstood 26 degrees of frost without damage, and, according to Hooker, it is hardy at Kew Gardens, London, England. E. Gunnii (cider gum.) Large trees have withstood 32 degrees of frost in New Zealand, and is hardy in many places in England and Scotland. It is found in alpine regions up to 5600 feet. Grows in almost any soil. Wood from the older trees is hard and durable. Tree of moderate size.

E. Stuartiana (apple-scented gum). Fastest growing of all the very hardy eucalypts. Prefers moist, sandy soil.

E. Regnans (swamp gum of Tasmania). In vertical growth it exceeds the "Big Trees" of California, one specimen being found to measure 471 feet. It has resisted 22 degrees of frost. Prefers cool, sheltered gullies. One of the strongest of all the timbers, but not lasting in the ground.

These comprise most of the valuable species that are suitable for mountainous regions, some of them having withstood zero weather without injury.

All young seedlings, however, are liable to injury by the hot sun, as well as by the early frosts, unless properly hardened in the early stages of their growth. Eucalyptus plants grown near the coast, where the air is invariably moist and cool, often receive a rude shock when transplanted to localities where extremes of climate are much greater. Grown where the summers are intensely hot and dry, it is necessary that the young trees be kept constantly shaded, or they will be burnt. This great heat, under shade, induces to a "weedy" growth, not desirable when transplanting time comes. It would seem, then, that a climate where the weather is warm, and where the tender seedlings may be exposed to the full rays of the sun, and where they will also face the sharp frosts of early winter should be, and is, an ideal location for the growing of these trees in large quantity. We move the plants constantly, from muslin shade over the seed boxes until well sprouted, to a lath shade, and then into the full sunshine, before transplanting. Then, after transplanting, to entire shade for one day, lath shade for a few days or a week, they then are exposed fully to the weather. There is nothing specially new in this, except that we find by an exact routine in thus handling the plants, all are hardened to stand great climatic extremes, and not a single plant wilts after transplanting. When the time comes for permanent planting in the field, we have a robust tree, inured alike to the burning rays of the sun or to many degrees of frost.—Leonard Coates, Morganhill, August, 1908.

EUCALYPTUS GLOBULUS. (Blue Gum.)

Eucalyptus globulus is only one of the 50 different kinds known in Australia as "blue gum." In California "blue gum" has been applied by common consent to the globulus. Another blue gum of Australia is leucoxylon," which McClatchie suggests should be called "white gum."

The eucalypts constitute a considerable part of the forests of Australia, and are said to give a characteristic appearance to the landscape of the regions in which they grow. They are known in their native home as gum trees, mahogany trees, box trees, stringy barks and by quite a number of other names, the first being the most common appellation. Notwithstanding the general use of the term "gum tree," the name is not an entirely appropriate one, as the exudations from the trees are in most cases not gums, but resins. The name "eucalypts," proposed by Baron Von Mueller, is more suitable and euphonious. The only Australian common names that have been generally adopted in America are "blue gum tree" for E. globulus and "red gum tree" for E. rostrata and several other species, indiscriminately. In Australia several species are known as blue gums and several as red gums. This confusion of names, due to the great number of the species, and to the application to the same species of different common names by the inhabitants of different colonies of Australia, makes it impracticable to designate a eucalyptus tree by a common name. It will probably be some time, even in their native home, before these trees have well established popular names for each of the 150 or more species.

The average condition of white potatoes on August 1 was 82.9 per cent of a normal, as compared with 89.6 on July 1, 1908, 88.5 on August 1, 1907, 89.0 on August 1, 1906, and 86.8 the ten-year average on August 1.

The average condition of spring wheat on August 1 was 80.7 per cent. of a normal, as compared with 89.4 a month ago, 79.4 on August 1, 1907, 86.9 on August 1, 1906, and 82.7 the ten-year average on August 1.

With the Citrus Growers

GUM DISEASE.

IN A recent article in the Los Angeles Times, State Horticultural Commissioner Jeffrey states that Judge A. F. Call of Corona has had much success in treating gum disease of citrus trees, and that his treatment is receiving general attention, and that drainage is the chief remedy used by the grower. [Judge Call's article appeared in the Cultivator of July 9th.—Ed.] Mr. Jeffrey states that a more rational school of horticulture is coming to the front and the physical conditions of the soil are claiming the attention of growers more and more. He states that gum disease is more prevalent in heavy soils than those of other character and that much trouble is brought about by the baking and imbedding of gravel about the roots. Our observations would lead us to believe that he is right, or at least, we cannot see fit to dispute him.

It is true that some of the worst cases of gum disease are found in soils that are so gravelly that it worries a five-inch stream to get across ten acres. In such cases, the natural conclusion would be that lack of water at frequent intervals would account for it. It is also true that trees in soils similar and also different have frequently suffered from lack of water, year after year and still show no signs of gum disease. So there you are. It is impossible to ascertain the physical condition of soils until you get into them. Surface indications are unsatisfactory. The impression some have, is that the soil immediately around the trunk of the tree is the seat of the trouble. That may be partly true though we cannot see how it can be to any great extent, because the feeding roots are mostly beyond the branches though there may be such a thing that poor condition of the soil immediately under the trees has most to do with the presence of the scaly bark gum disease.

We have in mind an orange grove in which we had occasion to spend much time and in which we never saw a case of this disease. This grove received a light dressing of stable manure last year and the trees were trimmed out on the inside occasionally, but the brush was stacked under the trees and around the trunks. The lower branches were allowed to grow to the ground, hiding all this rubbish. The under part of these collections of brush and leaves had rotted and formed a leaf mould mulch, not a spear of grass growing there, but the ground beneath was honey combed by earth worms. The spaces between the trees were in no better condition than hundreds of other groves, and while the crops of oranges were not excessively heavy, they were regular. But the point is the freedom from gum disease.

Mr. Jeffrey quotes Prof. R. E. Smith, in his statement, that there is a certain margin between health and an unsatisfactory condition classed as discase, and he also states that along this line of thought comes the idea that certain soils are easily kept in proper physical condition, while others are inclined to get out of such condition easily, and that there may be trees that are not so prone to succumb to these conditions and finally, there may be found a citrus stock easily kept in good condition. This last idea is in line with our observations. not only with sour stock but with certain strains of sweet stock as well. The Cultivator recently contained an article that advanced the theory that there may be some time found a stock that is immune, and that indications are that such already exist, not only as a budding stock, but a strain or strains of the commercial varieties which would resist the efforts that cause the disease, independent of the roots.—J. W. Mills.

CITRUS IMPORTS.

In a speech before the Citrus Protective League, Senator Perkins gave the following figures regarding the imports of oranges from the islands:

From Cuba, 1903 to 1907:

1903	151,519	lbs.....	$ 1,687
1904	226,142	lbs.....	3,671
1905	303,124	lbs.....	3,603
1906	541,489	lbs.....	10,164
1907	430,599	lbs.....	8,005

Imports of oranges from British West Indies from 1903 to 1907, inclusive, were:

1903	37,798,340	lbs....	495,256
1904	26,311,482	lbs....	338,395
1905	22,261,862	lbs....	269,194
1906	21,275,396	lbs....	249,658
1907	5,988,107	lbs....	75,839

The value of the citrus crop of California is $30,000,000, and the estimated consumption in the state, $1,000,000.

MANGO CULTURE.

Taking advantage of your kind invitation to give my views on the fancy mango question through your columns, for the benefit of our horticultural friends, I will endeavor to do so, as far as my knowledge extends in that particular line, says a writer in Porto Rico News.

The propagation and raising of the East Indian, Ceylon or Fancy Mango to an extent which might be called commercial is, as far as I can find out, a very recent industry in the United States, a few being raised by planters in Southern Florida. I have every reason to believe that mango raising will be one of the leading if not the leading industries in our tropical and semi-tropical climates. They are particularly adapted to the conditions of soil and climate in Porto Rico and grow remarkably fast, much more so than any I have seen in Florida. During my limited residence in Porto Rico, it has been practically demonstrated in our nursery at Bayamon what can be done by proper cultivation and care.

Few of the rare varieties have fruited in the United States, but I have eaten the Mulgoba and Sundusha varieties in Florida and they are certainly delicious, the word does not really describe the flavor. Their freedom from fibre and the absence of the unpleasant turpentine flavor so often found in the native mango, together with a firm, smooth flesh that can readily be sliced with a knife, are recommendations which place them far in advance of the common varieties. Of the flavor, I can only say it is "indescribable."

Mangos are shipped from Bombay to London, a trip of twenty days, in cold storage and arrive in very good condition bringing very remunerative prices. Now that some of our steamship lines are introducing cold storage to a limited extent, they can be sent from here to the United States safely.

I have seen fruit from young Mulgoba trees in Forida at the age of

CITRUS TREES READY FOR MARKET.

three years, and there is no reason why they should not do equally well, if not better, in Porto Rico. Quite recently we had blossoms on seven trees which were transplanted sixteen months ago from six-inch flower pots. They range in height from six to seven and a half feet and five to six feet wide at the top. This speaks well for the Porto Rican climate.

The Department of Agriculture is now considering ways and means of introducing them generally in Porto Rico after fruiting and classifying them. This will, of course, take some time, but when it becomes known that they head the list in the fruit line as money makers, they will receive much attention. With the able and highly trained corps of specialists we now have at the Mayaguez Experimental Station, we may feel assured of rapid strides in horticultural work in Porto Rico. No obstacles should be placed in their way as they will assuredly be of much service to us in many ways.

THE AMOUNT OF RAINFALL OVER THE SURFACE OF THE EARTH.

The discussion of observations on rainfall made first by Sir John Murray and later by Bruckner and Fritsche permits an estimation to be made of the mean rainfall on continents, which is found to be about 30 inches per year. The rainfall on the ocean is more difficult to measure, but it has been estimated by Supau; and Fritsche, taking account of all the known facts, estimates the mean annual rainfall for the entire surface of the earth at about 36 inches. Making use of this number, it is easy to calculate that the total rainfall amounts to 464 milion milions of metric tons per year, 1272 thousand millions of tons per day, 53 thousand millions of tons per hour, 883 million tons per minute, or 15 million tons per second.—Scientific American.

The Sunny Mountain Orange Wine Company is a recently incorporated body at Riverside. The company is at present operating in a small way but expects to have a large cement winery in the near future.

One Yuba county orchard will ship 45 cars of pears this season.

AFTER CALIFORNIA WEEDS.

A. C. Cox, connected with the U. S. Department of Agriculture, and whose special province is the investigation of weeds and their eradication, has been looking into the peculiarities and habits of our great vegetable pest, the morning glory. This is a member of the convolvulus family, and from its low, skulking habits is a disgrace to the more respectable members of the family. It will flourish under the most discouraging conditions and the more it is punished the stronger it grows. It is propagated in all possible ways, from seed when it is allowed to, but from root joints when it cannot go to seed. Cutting it out with the cultivator only spreads it as every particle of root left in the ground starts a new plant. Weeds are useful forms of vegetation, out of place, and about the only place where the morning glory would be of service would be at the north pole where it might carpet the barren waste with a verdant coat and lend its delicate white blossoms to brighten the landscape. We really hope that Mr. Cox will find some method of easily getting rid of the morning glory pest. When he gets through with it, we know a fine patch of Johnson grass to which we will draw his attention.

The most satisfactory land on which to plant an orchard is where soil has been previously cropped and is in a good state of fertility.

Deciduous Fruit Culture

THE GROSSE PRUNE.

THE plum known under the various names of Grosse Prune, Hungarian Prune and others, is perhaps the finest of all shipping varieties. It is large, handsome and has a delicious flavor when fully ripe. Like the Wickson plum, it has the rare quality of developing a good color and flavor after shipping, even when picked before fully grown. It must have developed at least a light tint of pink on one side in order to make this change, but some color develops before full growth is attained. The color is a deep red wine color and some specimens attain a size of two by three inches through the center.

The tree is a vigorous grower and an enormous bearer; in fact, is frequently broken down with its load of fruit. The wood is very brittle and careful pruning is necessary to insure against breakage. Thinning the fruit is also essential and can be done with considerable advantage in producing a high percentage of good fruit. The Grosse prune is prone to grow double and with a partly developed twin plum on one side of an otherwise good one. The half that loses "its grip" will often be a mere knob or a hard, sharp black beak either of which renders the plum unfit to ship. If these imperfect plums were picked off after the crop is set, it would result in larger sizes for those remaining and render picking less expensive. Many trees run from one-fourth to half imperfect plums, while others run as low as one or two per cent. imperfect fruit.

There is an excellent opportunity for type selection in the case of the Grosse prune; not only do many trees produce a large percentage of imperfect fruit, but some produce a large percentage of small fruit. Adjoining trees will do the reverse.

In planting the Grosse prune, it is essential to give them plenty of room, for they will not bear when crowded Twenty-four or five feet each way is close enough.

IRRIGATION OF VINEYARDS.

The recent hot spell of weather has demonstrated beyond a doubt to the Central and Northern California grape growers, that irrigation is a good thing in dry, hot times, and when they are equipped for such occasions, they will no doubt find that a good soaking of the drier parts of their vineyards during favorable seasons will be an advantage. It is quite noticeable that vines situated on land where the roots reach water were not affected by the recent hot weather, while the reverse is the condition on the high ridge adjoining.—J. W. Mills.

GRAPE GROWING DIFFICULTIES IN IMPERIAL VALLEY.

The conditions which confront the grape grower in the Imperial valley are so different from those of other grape growing districts that one who is successful in other places is liable to meet with partial or possibly total failure in this section. The climate, the soil, the manner of irrigation, are each a study and absolutely different than most grape growers have ever experienced. The newcomer who attempts to start his vineyard from cuttings does well if he gets a half stand to live through the first year.

My experience tells me that the best way for one who is new to this section is to plant his cuttings in nursery row for the first year. In this way he will learn how much water and care it takes to get grape cuttings to grow in Imperial soil during an Imperial summer. He will, by good care, get about one-half of these cuttings to make thrifty plants for next year's vineyard planting. Meantime he can be watering the ground for vineyard, which should be planted in January or February. They are then on the ranch and there is no loss or cost in transportation.

No cuttings should be longer than 12 inches. I like the three bud cuttings, not over 8 to 10 inches long for nursery planting. Do not leave any of cutting above ground.

There have been several kinds of grapes grown with varying success. The dark grape does not ripen up with a good "black." In other words it has too many light or purplish grapes in the bunch to be a successful market grape. The white grapes do not sunburn as badly and ripen more evenly than the dark kinds. The Malaga is and will continue to be the most productive shipper for the valley, though some think the Muscat will be a close second with Thompson Seedless a close rival. We must have a care and plant varieties which will make desirable raisins in case table grapes do not make satisfactory returns. Muscats make good sized bunches either for grapes or raisins. To secure good results, however, it is necessary to sulphur the vines to prevent mildew, and the work of a small insect that gets on the vines and grows over the bunches of young fruit making a web over the entire bunch.—Arthur S. Fell, El Centro.

ROOT ROTS.

This is the ideal time of the year to go over the orchard and pick out the trees affected with root troubles. An early ripening of the foliage or a slight bronzing of the leaves on all or part of the tree is often the first sign of distress. Of course, an early ripening of the foliage is not always an indication that the tree is affected with root rot. Anything which tends to interfere with the feeding process of the tree may cause the foliage to yellow early in the fall. The orchard should be carefully inspected at this season of the year and, if time will not permit of anything further, all suspected trees should be marked to be promptly looked after as soon as the rush of harvesting the crop is over.

Any plant disease which works upon the parts of the plant below the surface of the ground is hard to combat. In nearly all cases the farmer resorts to the rotation of crops, but this is impossible in the case of the fruit grower. Apparently two unidentified forms of root rot, due to the attacks of fungi, no doubt, are found in our orchards. While it is true that soil conditions may have much to do with the rapidity with which these diseases spread and their destructiveness, they cannot be said to be the initial cause of the death of the tree.

The most destructive root rot found in our orchards is the one which seems to show preference for the Ben Davis and the Gano apple. In a very few cases coming under my observation has it attacked Baldwin, Spitzen-

burg, and Grime's Goldon. The work of this root rot is not entirely confined to the roots, but often kills the bark well up on the body of the tree. This disease seems to spread rapidly from tree to tree, probably through irrigation water. When once infected the tree is soon girdled by a complete killing of the bark. It is sometimes detected in early summer by an oozing out of the discolored sap on the body of the tree. While the tree is in most cases girdled the first season, it does not die until the following season, when starvation of the root system and a drying out of the sap wood checks the upward flow of sap. The other form of root rot seems to confine itself to the root system and shows no great preference for varieties. The destruction of the tree is not so rapid, nor does it seem to spread so rapidly from tree to tree.

ORANGE AND PEACH ORCHARDS NEAR MERCED.

It is very hard to suggest any remedy for these root rots. In the case of the first, where careful examination shows only a small portion of the bark diseased, this may be cut away to healthy tissue and the wound washed with some disinfectant. For this work corrosive sublimate, 1 part to 1000 of water, may be used. This has proved of some value where the work is carefululy and thoroughly performed. Where the deadened area extends down on the roots, thorough work seems almost impossible and, as a result, the disease continues to spread. In the case of the disease where the work is on the roots entirely, remedial measures seem to be almost out of the question. The outcome of the work in controlling these troubles will depend more upon preventive measures than upon remedies. Affected trees should be promptly removed and burned. As observations would seem to suggest that irrigation water may be a medium through which the disease is transferred, the ditches might well be placed at greater distances from the trees. The soil should be kept in good condition, well cultivated, and not over wet.

The question is often asked as to the advisability of planting a new tree where an affected tree has been removed. So far as I have observed, no serious trouble follows such a practice. I think it well to remove the old tree and to allow the hole to remain open over winter. The action of the sun and the frost will do much to rid the soil of any remaining pound or two of blue stone in the traces of the disease. As a double precaution it may be well to place a hole and run water in to dissolve it. It would hardly seem advisable to replant Gano or Ben Davis where trees of either variety have been lost.

The grower should not rely alone upon this fall treatment to stamp out these diseases in the orchard. An occasional inspection of the trees during the summer and the cutting out of the diseased areas may save many trees. While it is often a great temptation to leave a tree until it matures its crop, the grower does this at his own risk.—O. B. Whipple, Field Horticulturist, Colorado Agricultural College.

WATCHING GROWERS' INTERESTS.

A movement recently inaugurated to protect the industries of California begins to excite active interest.

Chairmen of the several sub-committees of the California Tariff Revision Committee are asked in letters, individually addressed, to prepare as early as possible arguments in which there shall be set forth the necessity for the tariff protection of products of this state, and also dealing with the question whether the existing tariff on California products should be maintained or increased. Each chairman of a sub-committee is also requested to prepare statistics relating to acreage, cost of handling products and the disadvantage to overcome in competing with similar articles imported into the United States from foreign countries. These requests have been made by Arthur R. Briggs, chairman of the General Committee, and he has addressed his colleagues vigorously concerning the points involved.

This move marks the opening of a campaign fraught with important consequences to California. A mere enumeration of the committees is sufficient to indicate the wide scope that the work will take. Sub-committees have been assigned to the following classes: citrus fruits; nuts; wine and brandy; raisins and dried grapes; olives and olive oil; beet sugar; deciduous green fruits; dried fruits other than raisins and dried grapes; hops; lumber; minerals; manufactured goods, and miscellaneous products.

The field of labor includes the protection of industries that represent hundreds of millions of dollars of invested capital and that add many millions of dollars to the wealth of the state annually. These industries give employment to an army of men, women and children, distributed throughout California. In the general question of protection to home industries all persons in this state are financially concerned. The need, therefore, for immediate and concerted action is obvious. The extent of the damage that must fall on this state if the tariff on its products is tinkered with detrimentally, will be made to appear in figures and text.

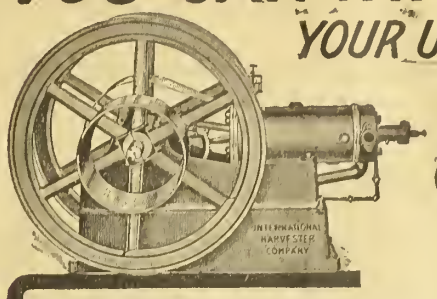
IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

Apple crop of Yucaipe valley and other mountain sections near Redlands is reported to be of exceptionally fine quality.

Elwood Cooper of Santa Barbara says he does not believe the Argentine ant has been found in California.

YOU CAN IRRIGATE YOUR UP-LANDS WITH AN I. H. C. GASOLINE ENGINE



NO need to go up stream and construct miles and miles of ditch to get the water high enough.

Place one of the powerful I. H. C. gasoline engines on the stream where it is nearest your land. There are large engines for irrigating on a big scale and smaller engines for small farms.

These engines are the best means for raising and utilizing the underflow; also for raising water from lakes, ponds, and wells, and also running streams.

They will raise all the water you need and deliver it just where you want it—in the ditch or in laterals.

The first cost of one of these I. H. C. gasoline engines is, in almost every case, less than the building of a long ditch to enable the water to flow naturally to the land.

And the cost of running is always less than the cost of keeping the ditch clean of drifting sand, silt, weeds and fast growing bushes.

In many cases, an I. H. C. engine enables you to reach the knolls and other high places which you cannot reach at all by ditch without expensive flumes that are "tumble-down" and must be repaired every spring.

The engines are made both vertical and horizontal and in many sizes from 1 to 20-horse power. They are easily controlled and run dependably. The irrigator does not need to give them constant attention.

Only an occasional return to them, to replenish the fuel and water supply, is all that is necessary. One man can handle the head of water in the field and at the same time attend to the engine.

International local agents will furnish catalogs and give particulars on all sizes of irrigating engines. Or write the nearest branch office.

GOPHER DOPE

Gophers destroy annually a large per cent of the crops, trees, lawns, etc., and they are a great nuisance to land owners all over the country.

The Gopher drives burrows or tunnels of very great extent and wherever it gains admission into a garden it works much damage to the roots of the plants. Every root that crosses the tunnel the Gopher will eat and not only herbs and flowers but even fruit trees of many years' growth have been killed by this destructive animal. In such cases the extremity of the tunnel is always to be found among the roots of some tree, which acts at the same time as a defense and a larder, for the Gopher hides itself under their protection and eats away their tender shoots.

A great many things have been devised to exterminate this pest with some success. Gopher Dope works on a different plan. It is in a powdered form and about one-quarter ounce placed well down in each hole and also in the run ways will soon rid the place of gophers. It gets in their eyes and pouches and on their feet. They track it through their tunnels. They will not stay where it is used. It will not harm domestic animals or fowls. It must be used thoroughly and systematically, the Gopher given time to work in it and any new holes thoroughly treated. If this is done you will soon find the place free from them.

Do not irrigate for one week after the dope is used.

Gopher Dope is sold in 50c, $1.00 and $4.00 tin cans, and is for sale at grocery, drug and hardware stores, also at feed yards, and is absolutely guaranteed or money refunded.

Free on board cars at Los Angeles. Live agents wanted in every county.

Yours very truly,

EUCALYPTUS SEED

Eucalyptus rostrata, the Red Gum
E. corynocalyx, the Sugar Gum
E. tereticornis, the Forest Red Gum
E. globulus, the Blue Gum
E. citriodora, Lemon-Scented Gum
E. cornuta, the Yate Tree
E. polyanthema, the Red Box
E. leucoxylon, Victorian Iron Bark
and Many Other Valuable Sorts

I shall be pleased to correspond with prospective buyers and give particulars as to prices on the seeds I am offering. Trial packets of any variety 15c each, 2 for 25c, or twelve for $1.25. Also young trees of many varieties for sale. Send for circular and cultural directions.

Irrigation and Forestry

GATHERING EUCALYPTUS SEED IN AUSTRALIA.

The following is a letter from Mr. R .S. Webb, a native Australian and an expert in the study of eucalyptus, who has gone to Australia to gather seed for the Johnson & Musser Seed Company, of Los Angeles:

"I received yours of May 16th safely. You say you hope I find the seed proposition as I anticipated, etc. Well, in reply to this, I would say I find the seeds are a little higher in price. Conditions here just now are splendid, never were better. Also, they are alive to the conditions in California on account of the numerous orders for seeds. The Forest Department here is jealously watching their seed trees and the exportation of seeds, etc., and are putting obstacles in the way of the collection from some of their best trees such as the Blackbutt, (Pilularis). This is the tree of trees and is the easiest to grow, and is the one we must grow on a very large scale. The Forest Department will not allow seeds to be got on government land from this tree, as they know the value of it. I am collecting with a Mr. Fitzgerald, who is considered the cleverest botanist here and the successor of Baron Von Mueller. We get our seeds from private property and, of course, have to pay to cut the trees down. I am living about forty miles out in the bush and work very hard with them. You should just see the trees; they are something grand to look at, and the seeds are all fresh off the trees and the best to be got in the world. We shall not get as many seeds as I thought on account of these conditions. I am sending about ninety-seven pounds by this boat. I am working myself with them and in this way getting them much lower. This tree I consider the best in the country for all general purposes. It grows almost as quick as the Blue gum and to the enormous height of 450 feet, straight as a shipmast. An ideal tree for us. The first thing I did was to go and see Mr. Perrins of the Botany Gardens and also Mr. J. H. Maiden, the great botanist. Then I went to the Forest Department and made all inquiries as to the best trees, etc. Then I went to the large lumber mills and saw the timber and made the fullest inquiries into all classes of their timber. The Jarrah, Rostrata, Terreticornis, Blackbutt, and all their different kinds. After a full investigation, I find it is pronounced on all sides that the Pilularis or Blackbutt is their finest tree for ties, bridge work and general use, (especially for telegraph poles). The turpentine (Lyncarpia) stands unrivaled for a pile or tie, beats Jarrah altogether for resisting marine insects and ants, etc. Tallow Wood (Microcorys) is another splendid wood and has a magnificent grain for finishing work. The Resinefera (mahogany) also beats Rostrata or Jarrah for furniture or general use. These four trees are ideal ones and will grow splendidly in the conditions existing with us. The Blackbutt is is how I expected in the first instant to get them so cheap. I expect to send another shipment by the Nanaka, which leaves here August 4th and gets into Los Angeles about September 2nd, so expect me also to return by that boat. I shall leave everything so arranged with these people so that we can get all future shipments just as we want them; in fact, to work as our agent here. They are first class people and thoroughly trustworthy every way, so it will be best for me to get back and start in with the growing. It will do all right to plant in September, especially for the Pilularis. This tree I intend getting all I possibly can of. I am bringing back some young trees and also some polished wood and anything that will be useful. I hope to see you all by September 4th, unless something unforseen happens."

* * *

We note above that Mr. Webb classes the Jarrah—Eucalyptus Marginata—with others which "will grow splendidly with us." We have yet to learn of a single case where the Jarrah has lived to any age in California. As to others Mr. Webb is doubtless correct.

Raisin buyers are offering 3¾ cents for 1908 raisins.

BEAUTIFUL OAKS OF COLUSA COUNTY.

MORE THAN 500 SQUARE MILES.

Three hundred and sixty-three thousand acres of land, hitherto untilled or upon which the productiveness was limited, was put under water or included in irrigation projects in the Inland Empire in 1907. This does not include the acreage of the projects at North Yakima, Lewiston, Sunnyside and others where the main ditches were dug before the beginning of last year; nor are the Twin Falls projects in Idaho, the Boise enterprises, the Jefferson valley plan or the numerous plants in the Boundary country included in the total. These would make the acreage more than 700,000.—Forestry and Irrigation.

A FEW ACRES OF TREES.

The importance of timber on the farm is becoming plainer each year. The uses and needs are many, and these increase as the farm becomes older. The one feature of fencing creates within itself almost a constant demand for timber for posts. Iron and stone are sometimes suggested as the coming fence post. This sounds as though the farmer was absolutely helpless in the matter of supply. The farmer need not look to any source outside his land resources for fence posts or fuel, if he decides that he will plan and produce these himself. The grove of quickly growing timbers will in a few years supply fence posts and fuel for all the needs of the farm. It is simply a matter of planting and preparing for tree growth.

It does not require the lifetime of a man to do this and reap the benefits.

There has been an astonishing neglect of opportunities lying at the door of a great number of landowners in the State. There is a vast acreage of land in California that is useless for raising cultivated crops, and of small value for pasture. The coast counties are covered by hills and mountains, steep, rocky and showing but scanty vegetation. Yet, it has been proved at hundreds of points that these lands will grow different varieties of trees—especially eucalyptus—that will in a few years from planting produce valuable timber.

Live Stock and Dairy

A FEW LATE IDEAS.

NEW TESTS for tuberculosis are under trial; at present there are two that are considered of importance to the dairyman. A further trial will prove if they are sufficiently accurate to be trusted before tuberculin is given up as out of date. One test is by the eye; this is used in human beings as well as in the cows. A small quantity of the medium is put into the eye; after a period the slight inflammation that follows shows the subject to be a victim of the disease. This test was suggested in the case of one of the Helm boys under trial for murder in Fresno last year. It was thought a jury would not convict a boy that was consumptive to prison for life. The idea was suggested, however, and if it was carried out it was not made a matter of public record.

Vaccination.

A form of inoculation with a virus is also under trial. This consists ot scraping the skin down to the quick and rubbing on the virus; after a certain time an irruptive rash follows, if the bacillia are in the animal system. These tests will not interfere with the use of tuberculin if the inspector is not satisfied with the reaction shown. The tuberculin test is not pleasant to make; indeed, it is very tiresome and disagreeable. Many of the most gentle old cows are quite rebellious when it comes to inserting the therometers. The breakage of thermometers is often a considerable expense. The excitement raised about diseased cows is a good way to make people interested; yet, infected human beings roam around and even serve eatables to crowds at places of public resort. The time is at hand when those having consumption that are not able to live without working will be provided with work that does not become dangerous to others. The cows are healthier than the people. I believe that there are few cities whose inhabitants would pass as well as the cows of Santa Barbara did the other day. Only two per cent reacted under the test. All of these may not have been affected with tuberculosis. Prof. Twitchell thinks there is a considerable loss of cows tnat react under tuberculin test from functional disturbances.

Pigs as Tests.

Again, the pig, a live one, not a blind pig, comes in for a tester. It has been suggested that to feed a pig with the milk of a suspected cow and to allow the pig to remain constantly with the cow, would furnish a fair test. If the pig remained healthy the cow could be presumed to be healthy. While the test was going on several other cases might develop of tuberculosis. Then think of the poor pig! Where, oh where, is the humane society!

Clean Milk.

After all chance of tuberculosis is weeded out of a herd, then a further duty to produce only clean milk is before the dairyman. It must be clean, wholesome milk, for milk may carry diseases other than those of the cow. As a medium of culture for bacterial growth milk is one of the best. Typhoid fever, scarlet fever and like diseases are traced to the family of the milkers and have been carried out to destroy many valuable lives by the milk. After the danger of disease is removed then there is dirt, simply dirt, that may make milk unwholesome by ferments that arise from its presence. Bowel disturbance and gastric trouble may arise from tainted milk.

Sources of Dirt.

Milk to be clean does not require a lot of fancy buildings, but it does require the buildings be kept clean. The dairyman, as a rule, furnishes cleaner milk than the ordinary farmer's cow for she gets the fag ends of everything including the dirt. The barnyards or corrals are a problem in the wet weather. Where money is plentiful a good pavement of cobble covered with asphalt, or a well graveled and oiled yard will solve the problem. These things cost money, however. The clean yards of the English stables are every where to be remembered, but these are not the work of one generation of people, but have been made by long years of repairing and building. These pavements look expensive to Californians, for, today the land owner is a dairyman, tomorrow he is a poultry sharp and the next year, goodness only knows what he may be doing as his new fad.

Barnyards.

The easiest way to keep the barnyard clean is to keep the cows out of it. Have the cow yards not right at the barn but near by; let the cows in at milking time only. A well raised and rounded pathway or road to lead to entrance door can be kept oiled and covered with ashes until it forms a solid walk. The cows will walk on this rather than in the mud and keep themselves clean. Nearly every barnyard is in a poor condition, if left to care for itself. A scraper can be used as soon as the first rains come to remove the manure-soaked earth and fresh soil scraped up around the barn. The walk is built as described and the cows kept from under the eaves of the buildings. The next winter the creamery will find a distinct improvement in the milk.

Finish the Job.

Corral scrapings furnish fine manure for the vegetable garden, Haul them there at once and spread them over the ground.

One source of loss of labor, and that is money, on a ranch is the half doing of a job. Finish whatever is in hand completely before doing the next thing. This does not mean that there may not be ten or twenty things in hand, but it means complete each one before stopping. There is truth in the old adage that "well begun is half done." Finish whatever is on hand before tackling a new job. If a load of manure is on the wagon, do not dump it any old place to get rid of it, but put it where it is to stay permanently. Then it is done with forever. The loss from half finished jobs is, on the ordinary farm, as great as that of the dairy man from poor cows. A little more thought, a little more care, this world would be a paradise instead of a load of worry and work.—M. E. Sherman.

CLAY BUTTERCUP 2d NUMBER 222132.

The above photograph is of the head of the famous milk strain shorthorn herd of John Lynch, Petaluma, Sonoma county. Another photograph of this same animal was given two or three years ago when it was but a few months old. It is a magnificent animal and from the milking strain of shorthorns which Mr. Lynch has specialized on for many years. One of the latest purchases of this ranch is Golden Horn by Cornplanter out of Kitty Clay 21st. This dam was out of winning shorthorn cow at the St. Louis Fair. Mr. Lynch writes he aims to have the very best dairy shorthorn line. The pedigree sent of Clay Buttercup II, is as follows: By Clay Buttercup 195881 out of Maggie. Clay Buttercup by imported Duke Buttercup 160769 out of Christmas Clay. Maggie by Favorite Billy 126738 out of Minnie. **Maggie the dam of Clay Buttercup II has a butter fat test of 6.20 per cent.**

Do Irrigation Work---Quicker and Easier

For Leveling Fields—For Cutting and Clearing Laterals

The photo is from an actual field-scene in New Mexico, where a 20th Century Grader is leveling seed-beds on the great truck-farm of Herman Blueher. He says: "Your 20th Century Grader has no equal for land-leveling, seed-bed making, ditching and for all kinds of irrigation work. I have reduced my force one-third since buying this machine." The

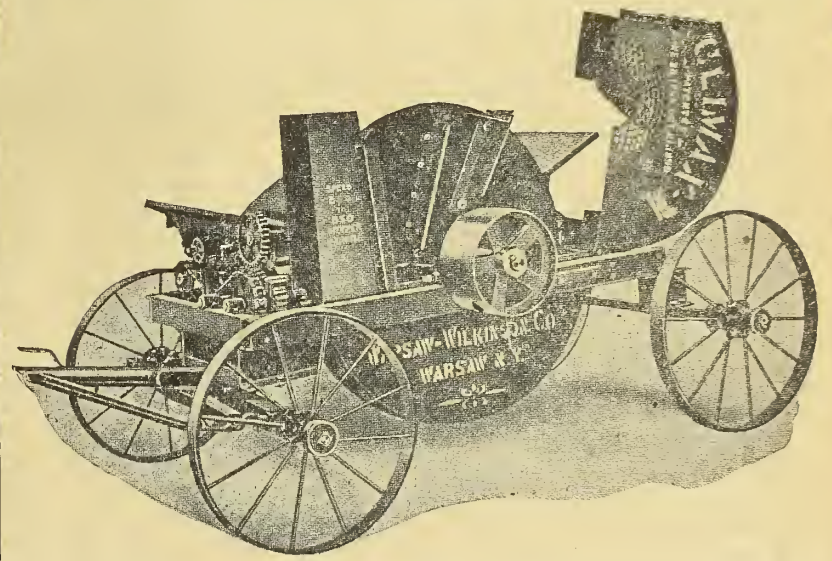
20th Century Grader

weighs only 600 lbs—light and handy—and is easily handled by one man and two horses. It is all steel and malleable iron. Price very reasonable. It pays for itself in one season. If your dealer hasn't it ask for name of nearest agent. Write now for new free booklet with large cuts showing every part.

Baker Manufacturing Co.

281 Dearborn St. Chicago, Ill.

Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

DRIED BLOOD FOR SCOURS.

A splendid tonic for calves. Costs about two cents per pound. For scours feed in milk. Give a teaspoonful at a feed and continue until the scours disappear. If calf is weak begin with smaller dose and increase. To prevent settling in pail keep stirred up while calf is drinking.

A Maligned Animal and a Neglected Industry

Written for California Cultivator.
BY MISS B. A. R. STOCKER OF ARROYO GRANDE.

THE milk goat industry is barely in its infancy in California. Our State Fair does not seem to know there are any goats except Angoras. Any of us could name two or three regular breeds. Yet these animals have been bred in many lands for centuries and have merits as pronounced as those of the Jersey cow.

Most any family in a small way that can keep a few hens and a garden, could keep two or three goats; and I can imagine few things within reach that would add more to their comfort and pleasure.

It can be arranged to have them come fresh at intervals of several months, and so keep up the supply of milk at all seasons, though if left to chance most of them will bring their kids in spring. Our best native does will give sometimes as high as a gallon of milk a day when fresh, gradually lessening in quantity till within a few weeks of coming in again. A common goat will begin with three or four pints, shrinking to a cupful in a few months. But a pure Toggenburg will still be giving two quarts ten months after being fresh. And such milk as it is! Cow's milk tastes sky-blue after it. Tea, coffee or chocolate tastes like a cheap adulterated article when instead of goat's milk cow's milk is used.

To keep a few goats a small enclosure is needed, with something, if only packing cases, for them to jump upon, for they need play and exercise to keep them in health, though staked out part of the time to forage.

For hay alfalfa is all right, but not grain hay. Seven or eight goats can be kept on the feed of one cow. Then for fresh succulent green stuff we can grow in this country all the year round some or other of these: Beets, carrots, cabbage, kale, dwarf Essex rape, rye, barley, millet, corn, potatoes (tops and all). The large cattle beets and Swiss chard furnish a supply of leaves for months together. Always break off the lower leaves. Some of our common weeds they are very fond of: Docks in every stage, sow-thistle, commonly called milk weed; burr-clover and knot-grass; bramble and orchard trimmings. Goats intelligently cared for ought to do better in California than in Switzerland, because of our open winters and cool summers.

Some who would love to keep a nanny goat may be deterred by the terror of the necessary evil—a billy! I remember an animal of this kind—who could forget him? A terrible old black pirate, shaggy with huge horns and yellow eyes, kept always on a heavy chain by a wagon shed in the China garden. None but the Mongolian could have stood him around. When a little doe went up that way the rope that was on her still carried the fragrance of the Celestial garden hanging on a wire fence ten days later.

Now we have a well bred animal ourselves who has no smell, and are getting one of Toggenburg blood with still further advantage of having no horns. After all, one is enough for quite a neighborhood.

The work around goats is light, clean and very fascinating. The goats are clean to daintiness themselves; and the milk pure and sweet. The well bred animals are quite beautiful. I believe our people will be won in increasing numbers to keep a few milk goats when they see some of the better specimens—not the shaggy-bearded brutes of doubtful gender, with horns half a yard long that they have seen tied to telephone poles in the outskirts of town, but sleek and fine as a wild roe, with big bag of milk carried high between the legs. Indeed, many now are inquiring for goats and have to wait in some cases till they grow. If you can only get one doe kid she will soon be the darling of the family, and you will have got your start. A man wanted four last fall and would not take one. The next comer snapped up the one and is still chuckling over the fine kids she brought him.

FISTULA AND POLL EVIL.

The word fistula is properly applied to sinuous pipes or ducts leading from cavities to the surface of the body, through which a discharge is constantly taking place. They are lined by a false or adventitious membrane, and show no disposition to heal. Fistulae may then exist at any part, but the name has come to be commonly accepted as applicable only to such discharges taking place from the withers, and we shall refer to this location when using the term.

Poll evil is a fistula upon the poll, and in no sense differs from fistulous withers except as to location. The description of fistula will apply then, in the main, to poll evil as well. Fistulae are particularly liable to occur at either of these locations from the disposition of the muscles and tendinous expansions, which favor the burrowing of pus and its retention.

In the earliest stage, when there is soreness, enlarged lymphatics, but no well-marked swelling, the trouble may be generally aborted. To do this requires both general and local treatment. A physic should be given, and the horse receive one ounce of powdered saltpeter three times a day in his water or feed. If the fever runs high, 20-drop doses of tincture of aconite root every two hours may be administered. Locally we will find much relief by pouring cold water from a height upon the inflamed spot for an hour at a time three or four times a day. Cooling lotions, muriate of ammonia or saltpeter and water, sedative washes, as tincture of aconite and opium, chloroform liniment or camphorated oil are also to be frequently applied. I have seen a number of cases presenting these initial symptoms of fistula thus aborted that required no other treatment than the avoidance of the original cause. When, however, the formation of pus is inevitable, this must be hurried as much as possible. Hot fomentations and poultices are to be constantly used, and as soon as fluctuation can be plainly felt the abscess wall is to be opened at its lowest point. In this procedure lies our hope of a speedy cure. If the parts are so laid open by the knife that the pus must escape as fast as it is formed, and where there is left no possibility of its burrowing between the muscles, forming pockets or sinuses, the parts rapidly and permanently heal without any mediation whatever, as though we had been dealing with a simple abscess of the withers, and not a true fistula at all.

Attention is again called to the directions given above as to the necessity of probing the cavity when opened. If upon a careful examination with the probe we find that there are no pockets, no sinuses, but a simple, regular abscess wall, the indication for treatment is to make an opening from below so that the matter must all escape. Rarely is anything more needed than to keep the orifice open and to bathe or inject the parts with some simple antiseptic wash that is not irritant or caustic. A low opening and cleanliness constitute the essential and rational treatment. If caustics are inserted, they cause sloughing of healthy tissues and favor the formation of sinuses by producing sloughs below the point of incision.

If the abscess has existed for some time and has not opened, its walls become thickened, the pus granular or inspissated, then, after an opening has been made by the knife and the contents washed and squeezed out as thoroughly as possible, the plan of treatment is materially different. There is enormous thickening of the walls, which must be destroyed and sloughed out by caustics. The best plan here is to make the first incision in the highest point of the swelling, introduce a piece of caustic potash (fused) one to two inches in length, carefully plug the opening with oakum or cotton, and secure the horse so he cannot disturb the parts by rubbing or biting them. The skin of the shoulder and entire leg must be thoroughly greased with lard or oil in order to prevent the caustic (should it escape) from excoriating the skin over which it flows. Twenty-four hours after the introduction of the caustic the plug is to be removed and hot fomentations applied. As soon as the discharge is again established we must make another opening with the knife or seton needle as low as possible, and keep this open with a seton. The object of making the first incision on top is to insure the retention of the caustic until it has attacked the entire inner surface of the cavity. If this is done the caustic causes sloughing of every portion of the diseased parts, leaving a healthy granulating surface underneath, which only requires that the depending orifice be kept open and the cavity washed out with a weak antiseptic solution once or twice a week to effect a cure.

It is to be inferred from the foregoing that, even though fully established, fistulae of the withers or poll are, in the majority of cases, curable. They often require much time and patient attention. The sinuses must be opened at their inferior extremity and kept open. At first caustic injections or applications must be thoroughly applied once or twice, after which mild stringent antiseptic washes and cleanliness complete the cure. In those cases where the sinuses or pipes are so directed that counter openings cannot be made, where there are diseased conditions of the bones, articulations, etc., that cannot be reached, the horse had often best be destroyed at once.—From Diseases of Horse by Department of Agriculture.

Prof. E. W. Major of the Agricultural College has selected some thoroughbred cattle for use on the state farm at Davisville.

The Gibson ranch near Woodland will soon have a sale of Shorthorns.

THE PRINCIPLES OF FEEDING ANIMALS.

It will be necessary to give the fundamental principles of feeding animals as stated by a few standard authorities. Allen says:

"The feeding of farm animals, like the use of fertilizers for crops, rests upon quite well-defined general principles. Our knowledge of these principles has been derived from the studies of the chemist and the animal physiologist, on the composition and functions of food and the way it is utilized after it is eaten. These studies have shown that the materials of the body are continually breaking down and being consumed, and that to keep the animal in a healthy and vigorous condition there must be a constant supply of new material. If this is lacking, or is insufficient, hunger and finally death result. To keep up this supply is one of the chief functions of food, but in addition to this the food maintains the heat of the body and at the same time furnishes the force or energy which enables the animal to move the muscles and do work, and also to perform the necessary functions of the body. In furnishing heat and energy the food may be said to serve as fuel. If, in addition to repairing the wastes of the system and furnishing it with heat and energy, growth is to be made (as in the case of immature animals) or milk secreted, an additional supply of food is required. To supply food in the right proportion to meet the various requirements of the animal, without a waste of food nutriments, constitutes scientific feeding. It is by carefully studying the composition of feeding stuns, the proportion in which they are digested by different animals and under different conditions, and the requirement of animals for the various food nutriments when at rest, at work, giving milk, producing wool, mutton, beef, pork, etc., that the principles of feeding have been worked out. In applying these principles in practice the cost and special adaptations of different feeding stuffs must of course be taken into account."

Butler and Kilgore state:

"What office do the nutriments perform in the animal economy? The ash, or mineral matter, furnishes a large part of the material for the bony structure of the body, and, to a far less extent, of the soft tissues. Most of our feeds and rations contain an abundant supply of the mineral elements, so little or no notice need be taken of them in feeding.

"Protein differs from all the other nutriments in containing the element nitrogen, and is largely the producer of flesh, ligaments, muscles, tendons, hair, hide, and to a greater or less extent all other portions of the animal body. The protein bodies are of the utmost importance in the animal structure. They compose the larger part of the animal machinery and are the exclusive source of its repair as occasioned by the continuous wear and tear of the system, due to the internal and external movements of the body; they are the basis of blood, and the source of casein in milk; and in the absence of sufficient quantities of fat and carbohydrates in the feed for the production of heat and energy, they are transformed into fats and perform the office of fats in nutrition. This latter transformation may also result from an excess of protein. The heat-producing power of protein is but little different from that of carbohydrates; the amount of fat it produces is probably much less, while, as a heat-producer, fat is worth about 2.4 times as much as protein. These facts, combined with the high cost of protein in feeds, render it usually uneconomical to feed protein for the production of fat to be either stored in the body as such, or to be used as fuel, since the fats and carbohydrates perform these offices and cost much less. It is to be remembered that the protein bodies are the 'flesh formers,' and though they can perform the offices of fat and carbohydrates in nutrition, fats and carbohydrates cannot take the place of protein.

"Fats and carbohydrates perform the same offices in the body—those of the production of heat to keep the body warm, and the force by which the animal mechanism is run. They are the 'heat and force producers,' and are consumed in the body as fuel, giving out heat, muscular, and other energy. For the production of heat and energy one pound of fat is worth about 2.4 times as much as a pound of carbohydrates. Fats give out about 2.4 times the heat that carbohydrates do. Besides serving as heat and force producers, carbohydrates are converted in the animal body into fats, and, together with the fats of the feed, are stored as such in fatty tissue. The value of carbohydrates for the production of fats is supposed to be in about the same proportion as the heat-producing powers of carbohydrates to fats.

"The carbohydrates, fed are not found in the animal body as such, but are converted into fats. There are, therefore, only four classes of substances composing the animal body, viz.: water, ash, fats and protein.

"The main and distinctive offices of the nutrients of feeds are: Ash, or mineral constituents, are bone-producers; the protein bodies are the flesh-formers; and fats and carbohydrates are the heat and force producers. The nutrients already located in the animal body perform the same offices as the corresponding ones of feed. In cases of a deficiency of nutrients in feeds given, the fats, or protein and fats, are drawn upon to assist in running the animal machine. Carbohydrates and fats, in being consumed, prevent the consumption of protein, but as soon as they become insufficient to supply the necessary heat and force for the body, protein substances, in the form of lean meat or muscles, etc., are drawn upon. A sufficient supply of carbohydrates and fats is, therefore, necessary to the protection of the animal framework. The following is a statement of the facts in a tabular form:

Feed nourishes and supports the body by supplying—1. The materials of which it is made. 2. The materials to repair its waste and wear.

By producing—3. Heat to keep it warm. 4. Force and energy for muscular and other work.

The offices performed by the nutricents are as follows:

PROTEIN.

Protein is the basis of blood, lean meat, tendons, ligaments, hair, skin, etc.; is converted into fats; is used as a fuel for heat and force.

FATS.

Are used as fuel for heat and force; are stored in the fatty tissue of the body.

CARBOHYDRATES.

Are converted into fats and stored in the body, or are used as fuel for heat and force.

MINERAL MATTER.

Forms a large part of bone and a very small part of other tissues.

Dalrymple says: "As a general proposition it may be stated that the foundation principles of nutrition are the same in the case of animals, and that the function of food is (1) to supply material to build up and repair the tissues of the body, and (2) to yield energy. Hence, the intelligent use of food is directed to supply the waste of the materials occasioned by the act of living and the performance of work. And, according to the amount of work performed, and, consequently, the amount of material (tissues) used up or consumed within the body, the amount and ingredients of the food have to be regulated. And, as well known, combustion, or the creation of heat, produces energy in some form, which takes place when the food is consumed or burned up within the animal body."

The investigator of animal nutrition today is busy compounding and balancing his rations. The history of animal industry shows that up to comparatively recent years all cattle feeding was done on the pasture—resort was had alone to nature. This was largely true even of the milch cow. Of course the work animal has from the earliest time been fed mainly on food gathered and more or less prepared for him by his master. Under present conditions, nature is only a starting point, animal feeding has become a fine art. When the pasture was no longer broad enough or rich enough for the ox, cow, sheep, hog, they were taken to the barnyard and fed there on stuff gathered and stored for their maintenance.

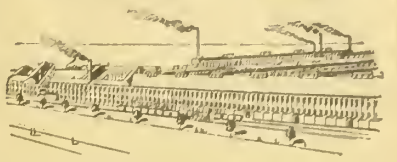
EXCLUSIVE
Tubular
ADVANTAGES No. 9
The Largest Separator Factory in the World Is Back of the Tubular.



This means that when you buy a Tubular you get the highest type of machine the most successful manufacturers can turn out—a separator so superior to others that the demand has made necessary the largest factory of its kind in the world to supply it.

You get a machine that has been selected by the greatest number of separator buyers—hence the greatest demand.

You get a machine built by the most skilled separator builders—better material and better workmanship than in other separators.

Then why buy the second best or inferior makes? Get the machine that is good enough to be guaranteed to leave 50 per cent. less butter fat in the milk than any other on the market or no sale. We have been making Tubulars 28 years—that's why we can make them enough better to offer them on such a strong guarantee.

A postal brings our catalog No. 260 containing in full this remarkable guarantee and explaining the reasons why the Tubular has no equal. Send for it today.

MORE MILK—MORE MEAT
IF YOU USE
LILLY'S
BEST
FLY
KILLER

I can positively testify to the merits of Lilly's Best Fly Killer. This is the first year that I have not had to fight grub in my cattle. I used it at first last summer having little faith, but the results quickly converted me. My cattle gave more milk, and kept in better flesh on less feed as a result, and I kept them in the stable all night.
A. F. CHAPMAN, Monohan, Wash.

Contents

FOLIAGE OF TWO EUCALYPTS, Cover.

SOME HARDY EUCALYPTS, 195.

CITRUS.—Gum Disease; Citrus Imports; Mango Culture; Amount of Rainfall; After California Weeds, 196, 197.

DECIDUOUS.—The Grosse Prune; Irrigation of Vineyards; Grape Growing Difficulties; Root Rots; Watching Growers' Interests, 198, 199.

IRRIGATION AND FORESTRY.—Gathering Eucalyptus Seed in Australia; More Than Five Hundred Square Miles; Acres of Trees, 200.

LIVE STOCK AND DAIRY.—A Few Late Ideas; A Maligned Animal; Fistula and Poll Evil; Principles of Feeding, 201, 202, 203.

EDITORIAL.—Press Information; Competent Inspectors; The Walnut Crop; Dry Farming; Southern California Fair; Institute Workers; California Live Stock Breeders, 204.

AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, the Coast, 205.

POULTRY.—Reliable Information; Chicks Eating Each Other; Probable Poultry Profits; Protect the Doves; Disease Caused by Close House, 206, 207, 208.

SMALL FRUITS AND VEGETABLES.—Blackberry Orange-rust; Cabbage Worms; Shasta County Onions; Greens, 209.

QUERIES.—Bermuda Grass; Galled Shoulders; Barley; Poll Evil; Peddling by Grower; Hard Milker; Cow Peas; Commercial Fertilizer; Lippia; Milk Fever, 210.

ORNAMENTAL GARDEN.—Improvements in Lily Culture, 211.

HOUSEHOLD.—Character Sketch; Ticket Scalper's Story; Recipes; Hair Tonic, 212, 213.

BEES AND THEIR CARE.—The Place of Bees on the Farm; Bees and Horticulture, 215.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 211, 215.

PRESS INFORMATION.

A vast amount of literature, carefully written editorial articles, interviews with leading men in large business concerns, and occasionally valuable articles along sociological and political lines are flooding the mails, addressed to farm papers and the editors thereof. In their general tone there is an evident argument that prosperity cannot return to the country until there is a cessation of the attack upon railroads and other public corporations. From an article recently received we quote the opening paragraph:

"Although the recent adversity came when the prosperity of the railroads was most pronounced, it was due to the attacks upon railroad credit by the administration, by national and state legislatures, and by railway commissions, which compelled the roads to stop all expenditures for improvement, as this attack upon their credit made it impossible for them to sell bonds or obtain money. The panic of 1907 was caused by the attack upon railway credit, which created a fear in the minds of the people which led them to distrust all securities."

No doubt can exist that the panic was caused by a fear in the minds of the peope which led them to distrust all securities, and possibly that fear was created by the action of the moneyed interests for selfish purposes. Many will not agree with the statement that it was due to the attacks upon raliroad credit by the National or state administrations. The "attack" made upon Standard Oil by the National administration, the "attack" made upon the great insurance companies by the state administration of New York, the "attack" made upon the railroads by the state administrations of various states in the South and Middle West undoubtedly weakened their financial credit for the time being. But shall it be said the attack was unjustifiable or wrong?

Why not face the square proposition and admit that "frenzied finance" was wrong, and that the promoters of the system must be driven from power and their apparently impregnable castles destroyed? If temporary disaster comes to all the people, is it not better so, than that the gradual absorption of the wealth of the country be continued in the hands of the pirates who were robbing the people generally in the insurance companies, in the trust banks of New York, in the railroad domination that precluded justice to the people and made rebates the test of business life?

Will the safe and sane and conservative business interests of the country consent and aid in an attempt to bring about a change or will they falter and side-step and try to maintain the conditions which have compelled government intervention? An exasperated and long suffering people will become more dangerous and remedies prescribed more heroic, the longer delayed.

In the meantime the rural prss is bcoming weary of filling waste baskets with prepared literature that carries in its opening or closing argument the statement that the National administration of President Roosevelt was responsible for the panic of 1907. The administration should keep after law breakers, let the results be what they may.

COMPETENT INSPECTORS.

The recent case of killing of several cows and injuring many others at the time of dipping for Texas fever ticks emphasizes the need for trained minds in county, state and government service. It has often been expressed by men who needed qualified inspectors and workers in large government propositions that the greatest embarrassment lay in the impossibility of securing competent help. The case in question in Orange county may not have been caused by incompetence. We do not know any of the particulars other than that the cattle were dipped for tick and later many died. The solution in which they were dipped was inspected later by government and state officials said to be competent to judge, but they have refused to make any statement as to whether it was faulty or not. But as the work was done under the supervision of a county official the presumption is that in some way that official is to blame.

This is spoken of at this time to call the attention of young men fitting themselves for life work to the need for trained minds to keep up the work which is continually growing greater every day. True it is often said that political pull is necessary to secure such positions even if one is qualified. But we believe civil service rules are prevailing more and more every day and that ability is winning more respect.

THE WALNUT CROP.

Regarding the coming walnut crop, Mr. J. A. Montgomery, secretary of the Walnut Growers' Association, of Southern California, writes: In reference to outlook for walnut crop will say that reports we receive would indicate a fair crop, some sections reporting outlook better than last year, other sections reporting not so good. If the walnuts now on the trees come to maturity the crop will probably be a slight increase over crop of 1907. We are receiving reports of sunburned walnuts, from various districts and the crop may be materially reduced from this cause.

The executive committee from the various walnut growers' associations of Southern California, will meet about the 15th of September to discuss the foreign and domestic crop and market conditions. This will no doubt lead to the local associations naming prices.

DRY FARMING.

Some months ago the Cultivator mentioned a particular example of dry farming. We refer to the results secured by Mr. Borof of San Fernando, by his method of preparing the ground prior to planting the seed. In other words he "cultivated his crop" before it was planted. We have seen other references to Mr. Borof's success on his ranch, and while it is to a certain extent due to excellent soil which retains its moisture, yet the thorough tillage is worthy of its proper credit. Mr. Musser of the Johnson Musser Seed Company has also secured some remarkable results by this thorough tillage.

The present is the proper time to take up this matter for next year's crop. Let the soil be prepared for receiving every drop of water which may fall during the coming season and then let it be so handled as to retain every particle of the moisture possible. Questions along this line sent to the Cultivator will be referred to experienced soil tillers and answers given as soon as possible.

SOUTHERN CALIFORNIA FAIR.

Circulars are issued announcing the holding of the Sixth District Agricultural Fair, or rather, a Southern California fair, on the grounds of the old Sixth District Association in the city of Los Angeles. It has been many years since a fair was held in Southern California, and the promise is made that this will be one of the old-time fairs, taking in all branches of agriculture and horticulture. Dr. J. A. Edmonds is manager of the association.

INSTITUTE WORKERS.

The next annual meeting of the American Association of Farmers' Institute Workers will be held at Washington, D. C., November 16 and 17,

At the same place, and beginning November 17, will be held the annual meeting of the Association of American Agricultural Colleges and Experiment Stations. The secretary of the Associations of Colleges and Stations writes: "It seems impossible to secure reduced railroad rates."

CALIFORNIA LIVE STOCK BREEDERS.

Secretary E. W. Major of the California Live Stock Breeders' Association writes us that the association will hold its fifth annual meeting at the pavilion at the State Fair grounds, Sacramento, Tuesday evening, September 1, at eight o'clock. At this meeting there will be addresses on matters pertaining to the live stock industry of the state. The annual business meeting will occur the same day at five o'clock.

Shop Talk

CALIFORNIA FRUITS.—We had the pleasure of a look a few days ago through the first pages of Professor Wickson's revision of his California Fruits and How to Grow Them. This book will be larger than the former edition and an entirely different appearing book. It is a book eight by eleven inches, of the size of the more recent horticultural cyclopedias and reference books. The pages are arranged in two columns instead of the usual single wide measure page. It will be profusely illustrated with half tone and other engravings. With these improvements, we understand, it is to be retained at its former price, $2.50. As soon as issued the Cultivator will announce it, that our subscribers may secure the latest edition of this valuable book.

CANDY BOOK—Orders are still coming in rapidly for the recipe book, "Home-made Ice Cream and Candy Book." It is surely a very attractive little book and is appreciated by **Cultivator** readers. Better join the crowd and send in your renewal for a year in advance according to the ad on another page.

SUNSET MAGAZINE.—All **Cultivator** readers should keep in mind the offer made last week giving the **Sunset** and the **Cultivator**, one year each, both for $2.00. This is a very reasonable and valuable offer and is good with renewals or new subscriptions. Better take advantage of it while fresh in mind and order at once through this office. The **Cultivator** makes no profit out of this offer, but makes it only to induce prompt renewal and to be of service to its readers. Cut out and mail the order blank found on another

Agricultural Notes of the Pacific Coast

Northern California

Roseville winery recently burned but it will be rebuilt.

Large quantities of barley are being stored at Red Bluff.

Marysville cannery took a large quantity of plums this season.

An orchard near Chico was seriously damaged by the recent forest fire.

Sugar beet growers about Hamilton report the crop exceedingly profitable this season.

Farmers of Cottonwood, Shasta county, are finding excellent hog feed in a big crop of acorns.

Grass Valley furnished the first Bartlett pears for shipment for Nevada county this season.

Oroville, Butte county, has issued a small booklet calling attention to her agricultural advantages.

Wineries are generally overstocked with last year's product, so that buying for this year's crushing is very uncertain.

Sebastopol, Sonoma county, will contribute several boxes of her best apples for government experiments in cold storage.

With $7 to $10 per ton as highest prices paid for wine grapes there are many discouraged growers in Sacramento valley.

Grape growers of St. Helena, Napa county, met recently and pledged 3000 acres in the campaign of education for wine consumption.

Pomona Grange of Sonoma county recently met at Two Rock. An address was made on the question of co-operative marketing.

The Contra Costa County Gazette claims that some of the alfalfa land in that county will produce five crops per year without irrigation.

Peach pits at Yuba City are selling at $6.50 per ton for fuel. They are claimed to be nearly as good as coal and are only half the price.

Red Bluff peach trees are loaded with immense crops. This is especially true of Muirs, which are bearing exceedingly heavy this year.

Hop growers of Northern California expect to organize and co-operate to the end that they may secure proper compensation for this year's crop.

Wine grape growers of the state recently held a meeting at Sacramento to discuss the possibility of securing better returns for their grapes.

Fruit growers in nearly all sections of the state are discussing the possibility of tariff revision and the necessity of watching fruit growers' interests.

Calaveras Big Trees and many other large forests of Northern California have been in danger from the fierce fires which have raged in the Sierra Nevadas.

The small dairy, used as an educational factor at the Agricultural College at Berkeley, will be transferred to Davisville to be used as a nucleus for a new and larger herd.

Petaluma recently shipped by the little steamer Gold the largest single consignment of eggs that ever left town. The lot consisted of 1460 cases, containing a total of 43,800 dozen, at a value of $16,000. The shipment was destined for Alaska. It required a quarter of a million hens a week to lay the eggs.

Central California

Sanger, Fresno county, shipped last week 25 cars of grapes.

Visalia was given a taste of a genuine Eastern thunder storm the first of the month.

A Tokay grower at Acampo has sold the fruit crop from his 18-acre vineyard for $4000.

Red spider has done much damage to deciduous vegetation in some sections of the San Joaquin valley.

The contest between Eastern wholesalers and the California Dried Fruit Association is yet unsettled.

San Jose and surroundings are making an effort to make the "Garden City" a "spotless town" by a campaign against weeds and rubbish.

Porterville irrigators have organized a local company to supply electric power for their pumps and light for their homes.

A Lodi inventor has placed on the market a grape capping machine for nailing tops on grape crates. It is said to be a great labor saver.

The Tule River Citrus Association, Porterville, is to make extensive improvements in its packing house before the next season begins.

Prof. Bioletti says that the Zinfandel grape is not fit to be classed with wine grapes, excepting as it is good for the manufacture of "dago red."

A Stanislaus county turkey raiser lost over thirty fine fat turkeys valued at $100, from the raid of a single coyote in his flock one night recently.

A burning cigar stub was the cause of a field fire near Fresno recently by which 600 acres of stubble and a combined harvester were consumed.

Some Fresno raisin growers maintain they have sold raisins at four cents, but all buyers stoutly maintain they have not made that price this season.

Melon growers of San Joaquin valley have all secured better prices this season than for some years. This is thought to be due largely to shortage of crop.

Deciduous fruit dryers are pleased with the lower rate on apricot pits, which has been granted by the Interstate Commerce Commission. The former rate was $1.00, which is now lowered to 80 cents.

G. Harold Powell and his corps of workers in Lodi, San Joaquin county, are gathering information as to methods of grape shipping and giving instructions to grape growers as to the best methods of packing.

The Lodi Fruit and Produce Company has just completed and permitted the public to inspect a new concrete building 50 by 150, basement and two stories for the manufacture of unfermented grape juice.

A Zante packing house is to be overhauled and put in the best of condition for handling the coming crop. These improvements are occasioned by the investigations of G. Harold Powell as to the manner of fruit handliug.

Sauta Clara valley orchardists have been repeatedly threatened with violence if they persist in employing Japanese labor and the sheriff of that county has issued warning to the farmers and given instructions to arrest any suspicious characters.

Southern California

Orange county is planting millions of eucalyptus trees this season.

Upper Yucaipe valley was visited by a severe bush fire last week.

Ventura apricot growers are holding their crop for 8 cents per pound.

Apricots have been shipped from Orange that were bought at 5 1-4 cents.

About one-fifth of the orange acreage of Orange county is given to valencias.

Santa Ana sweet potato growers are receiving about $2.75 per hundred pounds.

Riverside claims the highest priced car of orauges which on June 3 sold for $5.10 per box.

Riverside county has eight spraying outfits and one fumigation crew at work on red scale.

Silsbee, Imperial county, has established a nursery for the production of eucalyptus trees.

Fullerton Sweet Potato Growers' Association marketed over 12,000 sacks of spuds last season.

The government has appropriated $25,000 for studying the question of evaporation of the Salton Sea.

Riverside county's grain crop will be fully as heavy as that of last year and prices will be larger.

Interest in the growing of cotton near El Centro is increasiug and quite a planting is promised for another year.

Imperial Valley has shipped a number of cars of honey this season and already has an enthusiastic beekeepers' association.

A San Diego olive grower visiting Imperial valley maintains that conditions are right there for a fine production of olives.

An Oxnard shop has invented and is manufacturing a self-dumping beet bed which is claimed to be a remarkable labor saver in the handling of sugar beets.

Orange county production of chilis this year will be 20 per cent lower than that of last year. But very little of it will be dried. The price for the canneries will be from $22.50 to $25.00 per green ton.

The recent decision of the Interstate Commerce Commission to grant to Florida citrus growers a lower rate, brought forth expression from the committee that in no case would the rate from California be raised.

Already the Imperial melon growers are looking forward to next season and endeavoring to formulate some plan by which the profitable cantaloupe may be made to bring profit into the pockets of the grower.

The power walnut gatheriug machine is promised to be a complete success. The machine is operated by a gasoline engine and pump connected with a four-inch hose, which by suction draws up the walnuts from the ground.

Claims to the amount of $470,000 have been filed by the ranchers in Imperial Valley against the California Development Company, the Mexican Auxiliary Company, Water Company No. 1, and the Southern Pacific Railroad, for damages owing to floods at the time of a break in the Colorado levee.

The Coast

Bellingham, Washington, fair is being held this week.

Walla Walla, Washington, apple orchards will yield a half million boxes of fruit.

The heaviest crop of cherries ever harvested at Cove, Oregon, was gathered this year.

Some farms at Pullman, Washington, averaged 50 bushels of wheat per acre this season.

This year's wheat crop of the state of Washington is estimated at about 60,000,000 bushels.

Walla Walla, Washington, reports the greatest acreage of corn ever raised in that section.

Oregon State Fair Association has set aside Friday, September 18, as Agricultural College Day.

Farmers near Garfield, Washington, are organizing for a regular campaign against Jim Hill mustard.

Lake View, Oregon, is appealing for better transportation facilities to move its immense crop of apples.

Two threshing machines were destroyed at Umatilla, Oregon, by explosions caused by smut in the wheat.

Western Oregon hop men have greatly benefited by a rain which came about the middle of the month.

Hundreds of harvesters are in operation at Lewiston, Idaho, having started on the grain about August 1.

An area of 165 square miles in the heart of Eastern Oregon grain section was laid waste by hail storms recently.

Seven barns on the grounds of the Walla Walla, Washington, fair grounds were recently destroyed by fire.

Burning forests near Asotin, Washington, have caused the destruction of a large number of sheep being pastured there.

Fruit growers along the Columbia, tributary to Wilbur, have received good returns for their large fruit output this season.

Posibilities of irrigation at Grant's Pass, Oregon, are being realized, and outside capital is entering to encourage its extension.

Idaho and Eastern Oregon woot market which has been depressed so long begins to show life, and a number of sales have been made.

Shipments of green fruit from Pullman, Washington, have met with indifferent sales owing to financial conditions of Eastern markets.

Grant's Pass, Oregon, is busy marketing one of its finest crops of apples. It has been found that spraying for codling moth has been very effective this season.

Farmers of Quincy, near Wenatchee, Washington, are planning for water for irrigation. Heretofore dry farming has been the method of raising crops.

Many raids of coyotes on sheep herds near Albany, Oregon, have been so exasperating that an organized movement is to be made for their extermination.

Hop growers of Oregon and Washington have combined and agreed to gather only a portion of the coming crop as it is deemed prices will be too low if the entire crop is picked.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

RELIABLE INFORMATION FOR THE POULTRYMAN.

UNDER the heading of Another Good Poultry Bulletin, A. F. Hunter in the American Poultry Advocate, summarizes and comments on bulletin 115 of the West Virginia Experiment Station, as follows:

Both summary and comment are worthy of careful consideration.

This experiment was begun November 1st, 1906, and carried through to October 31st, 1907. Six hundred Single Comb White Leghorn pullets were put into the nine pens of a house 180 feet long by 16 feet wide, built with the Maine Station curtain-front pens and curtain-front roosting closet; the pens were 20x16 feet each, the middle compartment of the house being used as a feed room. The house was built of rough oak boards roofed with three-ply tarred roofing paper, and cost, complete, $700.

The pullets averaged about five months old at the beginning of the experiment, and rather few eggs were laid the first two months. There was one slight outbreak of roup, due to the birds becoming overheated from the attendant shutting down the curtain in front of the roosting closet before the weather had become really cold. A few died from this trouble, some from an unknown digestive trouble—total deaths, 54. These, however, were replaced by other similar pullets, so as to keep up the number to 600.

On pleasant days during fall and winter the fowls were allowed to run outside the house in one large flock where they had free range. It was thought at first that perhaps the fowls might crowd into certain rooms at night and thus cause trouble. This difficulty was entirely avoided, however, by having the small openings through which the fowls pass outside, open in front of the house and in the rear, so that the fowls in one section pass out in front of the house, and the fowls in the next section pass to the rear of the house, and so on. This leaves a space between each opening of 40 feet, and the fowls are much better able to find their way back to their proper division than though all of them were let out on one side of the house. Also when the pullets were first placed in the house care was taken to let out only one pen at a time until the fowls became thoroughly accustomed to returning to their proper roosting room. During warm weather the fowls had free range except for about three weeks in spring

Amount and Cost of Feed Consumed.

	Lbs.	Cost
Corn meal	3441	$ 42.88
Wheat bran	5434	71.74
Wheat middlings	2932	39.82
Oil meal	950	18.72
Wheat	10509.6	152.21
Corn	8952	103.81
Beef scrap	2443	57.70
Green cut bone	178	1.33
Ensilage	1536	3.75
Rye	1120	16.80
Ground oats	337	5.73
Oyster shell	1510	8.30
Mica crystal grit	1400	7.70
	Gals.	
Skim milk	205	4.10
Total		$534.59

The number of eggs produced during the year was 67,757, which were valued at the retail price prevailing in the local market and the total value of the eggs was $1,458.87; an average of $2.43 per fowl. The period of lowest prices, 20 cents per dozen, extended from the middle of March to the middle of June; the highest prices, 35 to 40 cents per dozen, was from October 1st into January.

Concluding Statement.

If we deduct from the total value of the eggs the cost for feed, then there remains a balance of $924.28, which must cover the cost of caring for the fowls, the death losses, the depreciation in the value of the fowls, the interest on the investment and profit.

It is difficult to estimate accurately the cost for labor, as the man who cared for these fowls did other work, but an active man could undoubtedly attend to five or six times as many fowls as were in this experiment. If we assume the lower number, also that it costs fifty dollars per month for a man to do the work, then it would cost ten dollars per month per house or one hundred and twenty dollars per year.

During the year fifty-four hens died. At eight dollars per dozen these would amount to thirty-six dollars.

If we assume that the 600 pullets were worth four hundred dollars at the beginning of the test and that they depreciated in value during the year twenty-five per cent, then this depreciation amounts to one hundred dollars.

Assuming that the house and fowls represent an investment of eleven hundred dollars, then the interest at six per cent amounts to sixty-six dollars, and the account stands as follows:

INCOME.

For eggs	$1458.87
	$1458.87

EXPENDITURES.

For feed	$ 534.59
For labor	120.00
For fowls which died	36.00
For depreciation in the value of fowls due to age	100.00
For interest on investment	66.00
For profit on 600 hens	602.28
	$1458.87

The total profit from the 600 fowls was $602.28, or practically one dollar per fowl. The total expense for the year was $846.58, or $1.42 per fowl. There were produced 5646 dozen eggs at an average cost of fifteen cents per dozen, and during the year nine per cent of the fowls died from roup or other diseases. The fowls averaged 113 eggs each. It is possible that this somewhat low egg production could have been increased by some other system of feeding, but whether the increased egg production would have more than paid for the increased cost of labor is a question for future experiments to determine.

Some Comments Upon This Bulletin.

Part of the foregoing is quoted verbatim from the bulletin, part is condensed, and there are some interesting points brought out in it. We are very pleased to have the detailed statement of pounds of food consumed, and the cost prices. The charges of $120 for labor, $100 for depreciation of the fowls from the low valuation given them at five months of age, $66 for interest on investment in house and fowls, and $36 for fowls that died are aids to getting at the exact net profits, and after all these charges are put in there is a good dollar apiece profit for the year.

The outbreak of roup, caused by

shutting up the birds in the roosting closet too soon, while it was yet warm weather, comparatively, points its own moral. We believe that there were two or three mistakes made in the plan of the house, and that they followed too closely the Maine Station plan, without considering the milder climate.

In the description of the house the bulletin says:

"In order to maintain fowls in a healthy condition it is necessary, among other things, to furnish them a dry house in which to roost and pure air to breathe. This is particularly true in winter when the houses, as usually built, are apt to become damp, if warmly constructed, and the air impure.

"One of the most important advantages of the curtain-front house is that the house is perfectly ventilated all of the time. During stormy weather when the curtains are down the air circulates freely through the curtains, and when the weather is fine the curtain front is open and there is no tendency for the moisture present in the breath of the fowls to condense on the walls of the house and thus cause dampness. Also, when the front is open the sun has unrestricted entrance, which is a distinct advantage, for poultry house windows are usually so dirty as a result of the dust bath that sunshine has difficulty in lighting up the interior.
